Vendor's efforts to go beyond Linux aren't an easy sell, IT execs say

Red Hat Inc. marked the occasion of its first user conference last week by officially launching its Directory Server, the latest addition to its open-source software arsenal.

But Red Hat faces an uphill climb as it tries to build on the success of its market-leading Linux distribution with additional offerings that move higher up the software stack, according to some

analysts. They said the strategy puts the Raleigh, N.C.-based company into competition with better-established vendors that, in many cases, are its hardware and software partners.

That point was backed up by several users attending the inaugural Red Hat Summit here. Although the users said they like having open-source alternatives to the commercial products they now use, they added that it's unlikely that their companies will swap out their directory infrastructures or

Acquisition plan intrigues some users but leaves others with questions

Sun Microsystems Inc.'s agreement last week to buy Storage Technology Corp. for about \$4.1 billion could be a good deal for both companies, some users and analysts said. But it left others scratching their heads and thinking that Sun could have put its cash to much better use.

There was general consensus, though, that each company had little choice but to make a significant move. Sun, in particular, had to do some-

thing to boost its storage business and its overall market position against rivals such as IBM and Hewlett-Packard Co., according to IT managers.

Scott Briand, a senior IT analyst at Nova Scotia Power Inc. in Halifax, called the planned StorageTek acquisition an "eye-opener" that may

Several months ago, Nova Scotia Power purchased disk arrays from Hitachi Data Systems Corp. Previously, it was using Sun-branded storage products made by Hitachi, but Briand said Sun's rebranding "didn't seem to add a lot of value." He added that the purchase of StorageTek will prompt him to "look and see what [Sun is] doing and where Sun, page 16

Saving on data center real estate a big factor in buying decisions

Many users upgrade to new servers because they need performance gains or improved capabilities. But there's another reason that may be-

come an increasingly important factor in server purchases: the desire to avoid new real estate costs by deploying higher-density servers.

For instance, IBM last week announced an x86-based system that can scale up to 32 Xeon processors and is also designed to support the dual-core version of the chip that Intel Corp. plans to release next year. Among the companies that are testing the xSeries 460 server is London-based St. Paul International

AT DEADLINE

Red Hat Plans to Spin Off Fedora

Red Hat Inc. said it will create an independent foundation to oversee its Fedora open-source software initiative. Red Hat will still provide financial and engineering support for Fedora, but it hopes the Fedora Foundation will attract broader participation in projects. Mark Whittaker, Red Hat's deputy general counsel, shared the move to IBM's spin-off of its Eclipse development framework last year.

EDS Faces Possible \$166M Write-down

Electronic Data Systems Corp. may be forced to write down as much as \$166 million in its second fiscal quarter due to problems with an underbilled project, EDS said that by May 2, the end of its first quarter, it had learned that amount in the project. EDS blamed projections that the underlying workn't "achieve anticipated benefits."

Lawson Buys Swedish Vendor

The ERP market continues to consolidate with Lawson Software Inc.'s acquisition of Intella International AB for \$480 million in stock. The enterprise software company will separate under the Lawson name with U.S. headquarters in St. Paul, Minn., and international headquarters in Stockholm. The deal is expected to close by year's end.

Intel Discloses More About Yonah CPU

Intel Corp. has shed more light on its forthcoming dual-core mobile chip, confirming that the Yonah processor's two cores will share a single bank of cache memory. Yonah, the dual-core version of Intel's Pentium M processor, is slated to ship in the first quarter of 2006. Intel said Yonah has an integrated design that shares storage and power management resources within the chip.

HP Faces Scrutiny Over On-Demand Strategy

Vision for Adaptive Enterprise needs honing, users say

BY MATT HARMON

HEWLETT-PACKARD Co. today plans to expand on its Adaptive Enterprise strategy for on-demand computing by announcing two OpenView software tools for managing service-oriented architectures (SOA) and reporting on internal controls for regulatory compliance purposes.

Analysts generally praised the new products, but they and some officials from the OpenView Forum International (OVFI) user group faulted HP for getting off to a slow start on the overall strategy, which the company announced two years ago. Some said HP has created a broad vision for Adaptive Enterprise without clearly defining its parts.

"I don't think HP's done a good job of explaining Adaptive Enterprise," said Steve Wostal, a former OpenView user who is now a consultant at Indianapolis-based Pepperwe Consulting LLC, which offers OpenView implementation services.

"There's a gap between implementation and theory," added Wostal, who is also a former OVFI board member. "While the theory is great, I don't think the application has been provided. I want to see their implementation strategy."

Push for More Progress Wostal and others said they appreciate that Adaptive Enterprise follows the fundamentals of the IT Infrastructure Library, especially ITIL's guidance that IT systems be provisioned to be flexible for changing business needs.

But Thomas Reinzel, Pepperwe's president and CEO and president of the OVFI,

said he would give HP only a "B" grade for progress on its Adaptive Enterprise vision.

"People still don't understand the concept or central idea," Reinzel said. "There's still a lot to understand [about] what it means to be adaptive, and we've got a long way to go."

Part of what's confusing is that an Adaptive Enterprise approach can encompass so many major IT concepts, such as change and configuration management and virtualization of servers or storage devices, he said.

Bill Emmett, chief solutions manager for HP's management software business, defended the company's progress in rolling out products to support Adaptive Enterprise. "We've been pretty regimented with new technologies," he said.

For example, HP's OpenView Business Service Management suite, which was announced last year, provides a "very pragmatic approach for describing business processes," Emmett said.

Reinzel said HP appears to be heading in the right direc-

OpenView Group Embraces HP's User Event

THE OPENVIEW FORUM International's board last week voted unanimously to hold the group's 2006 conference as part of HP's new companywide user event instead of continuing to schedule it separately.

The OVFI is an annual HP Software Forum is produced jointly with the vendor, and this year's event starts today in Denver. But next year's conference will take place within the HP Technology Forum, which HP is launching this September as a vehicle for consolidating its various user-group conferences.

"Our goal is to kind of put a conference within a conference and... still maintain our identity," said Thomas Reinzel, president of the eight-person OVFI board. "The stakes are high, and we are concerned about the blending of software into a larger event. Whether we lose our identity - we need to monitor that."

The OVFI agreed to join the HP-led conference because of concerns that the company might not serve speakers or

technologists in the HP Software Forum in the future, Reinzel said. "I'll heads west, we have to head west," he explained.

Reinzel added that the user group, which has about 7,000 members worldwide, wants to "aggressively work with HP on broadening the number of people that get exposed to HP software." He said the change will be officially announced Wednesday at the OVFI's conference, which is expected to attract about 2,000 OpenView users.

Mike Pecker, co-chairman of the OVFI's New England chapter, said he and some other chapter leaders disapproved the merger plan. "While it makes sense for HP to push its many user groups to consolidate under a single umbrella, I worry that those groups could eventually lose their voice," said Pecker, who leads Forge Consulting in West Boylston, Mass.

The OVFI already plans to play a role at the first HP Technology Forum in New Orleans, as does the U.S. chapter of the

tion on Adaptive Enterprise with its two new OpenView products, although he noted that he hasn't been fully briefed on them.

The products, which are due to be announced at this week's HP Software Forum in Denver, include the OpenView SOA Manager and Compliance Manager. The latter tool is designed to provide reports on corporate compliance with laws such as the Sarbanes-Oxley Act.

SOA Manager is built around software that HP acquired when it bought Web services management tools vendor Talking Blocks Inc. in 2003. That product will become an "anchor point" between business users and IT, said Todd DeLaughter, vice president and general manager of HP's management software unit. "The tire-kicking around SOAs is now hitting the mainstream," he added.

© 54826

Encompass user group, which has its roots among the customer base of the former Digital Equipment Corp. The OpenView group will help develop content for sessions, but many of the details have yet to be worked out.

For the combined 2006 show, the OVFI has reached an agreement with HP that will let it fill both space to other vendors, which is a major source of the user group's funding, said Reinzel, who is also president and CEO of Pepperwe Consulting.

The OVFI was formed in 1993, and its first president was Richard Sturm, who is now an analyst at Enterprise Management Associates in Boulder, Colo. Sturm said a separate OpenView user event is no longer needed.

"I think the software event's main value is education, and that can be served at any event," Sturm said. And HP has other events over the coming OpenView conference anyway, he noted, adding that "it's not entirely independent."

Role Reversal: Audit Uncovers Gaps in SEC's IT Controls

Sarb-Ox enforcer has weaknesses in access controls

BY THOMAS HOFFMAN

The shoe is on the other foot at the U.S. Securities and Exchange Commission after an audit of the agency's 2004 financial statements revealed that the chief enforcer of the Sarbanes-Oxley Act had "numerous" information security control weaknesses of its own.

The audit, which was conducted last summer by the Government Accountability Office and published on May 26, found that the SEC "had not consistently implemented effective electronic access controls" around user accounts and passwords, access rights and permissions, and network security.

There's a touch of irony in the GAO's findings, since the SEC is charged with enforcing the Sarbanes-Oxley Act of 2002, which requires execu-

tives at publicly held companies to attest to their organization's internal controls.

"There's some Schadenfreude in discovering that the arbiters of what's right can't seem to get it right themselves," said Cathy Hotka, former vice president of IT at the National Retail Federation, who now runs an IT consulting practice in Washington.

Steps Taken

For its part, the SEC has already taken several steps to comply with the recommendations of the GAO audit—some initiated prior to the recommendations' release, said Corey Booth, a former McKinsey & Co. consultant who became the head of the agency's Office of Information Technology in early 2004.

Those steps to comply include strengthening the process of authorizing information systems accounts and passwords for SEC employees and discontinuing automa-

During fiscal year 2004,

numerous information security control weaknesses existed at SEC. Specifically, SEC had not consistently implemented effective electronic access control including user accounts and passwords, access rights and permission network security, or audit and monitoring of security-related events. It did not detect failures in its critical financial and operations systems.

tion for employees and contractors when they stop working for the agency. The SEC has also upgraded many of its intrusion-detection systems and firewalls, Booth said.

In addition, the SEC has since added four information security specialists to its Information Technology department and has created a more systematic process for vetting security issues in its IT development and deployment procedures, according to Booth.

The SEC expects to address all of the GAO's security recommendations by next June. The bulk of the work will be completed this year, said Booth. He declined to specify the amount to be spent on the work but did note that the agency was awarded a seven-figure increase in its information security budget for 2005.

Empathy for the SEC

Even though many auditors and corporate executives have grumbled about the time and costs required to comply with Sarbanes-Oxley, some said they are empathetic to the challenges that the SEC faces. "I respect the SEC—they're in an incredibly difficult position," said Joseph Luck Jr., CIO at Aviall Inc., a Dallas-based aviation aftermarket parts distributor.

Although Luck said he doesn't expect the SEC to face much backlash from corporate officers for its information security control gaps, he did say that the agency should be held to the same standard as the companies it regulates. "They have to eat their own food like everyone else," he said.

Marios Diamandis, international president of the Information Technology Governance Institute in Rolling Meadows, Ill., said the GAO findings aren't surprising, since "many corporations" have uncovered IT-related control issues in their Sarbanes-Oxley compliance efforts.

Said Diamandis, "They're a government entity that, like any corporation, has to take care of its controls framework." ■ 54898

GAO Says FAA Needs A Stronger IT Architecture

THE FEDERAL AVIATION Administration must develop a strong enterprise architecture if it is to successfully modernize its air traffic control systems, according to a report released last week by the Government Accountability Office.

The GAO had been asked by members of Congress to determine whether the FAA has effective management processes for developing and implementing an enterprise architecture that would serve as a blueprint for the modernization effort.

The FAA's enterprise architecture program today includes ten projects—one for its National Airspace System (NAS) operations and another for its administrative and mission-support activities.

The main problem with that effort, according to the report, is that the FAA hasn't yet established effective management capabilities for developing, maintaining and implementing an architecture.

A spokeswoman for the FAA said the agency is preparing a framework for the GAO's report, which it will submit to the U.S. Department of Transportation.

The GAO said it's "critical" that the FAA establish an effective enterprise architecture management program that has the early support of senior managers of the agency.

In its response to the report, the Department of Transportation said it plans to do so by setting up a steering committee, developing a policy to govern the development, maintenance and implementation of the architecture program, and having an approved architecture project management plan for the non-NAS-related effort.

—Linda Rosencrance

McAfee Shifts Its Focus To Intrusion Prevention

BY AJAHMUR HAJWAN

On the eve of McAfee Inc.'s annual meeting with financial analysts last week, *NewsWeek*, president of the San Francisco, Calif.-based company, spoke with Computerworld about McAfee's enterprise strategy and its plans to add new network access-control products next year.

What kind of enterprise-oriented products can users expect to see from McAfee going forward? As the heart of our strategy has

been a shift towards behavioral detection and intrusion prevention. Obviously, we're a company with a good pedigree in reacting to attacks with our antivirus software. But we saw several years ago that the threat profile and the speed of propagation would outstrip what most companies would be able to handle in terms of incident response times.

What about risk management products? You'll see the first real marriage of our risk management technology [which McAfee acquired when it bought Foundation Inc. last August] with our intrusion-prevention technology early

in 2006, with network access control products. We're going to call it the McAfee Policy Enforcer, and it will consist of a series of system software that does near-real-time vulnerability analysis on managed devices, plus network scanners from the Foundation product line.

A lot has been made of Microsoft's plans to lead the IT security market. Is the Microsoft threat to pure-play vendors such as McAfee overstated? Microsoft will clearly be a significant competitor. But our belief is that they'll be most effective in the consumer arena. Luckily, our channel strategy is focusing on two areas where they have less muscle — in PC OEMs and in service providers. [But] Microsoft will present a bar that we have to clear in terms of added value. ■ 54898

Nortel Ships Fix For VPN Bug

Nortel Networks Corp. is offering a fix for a vulnerability that could let an attacker crash a virtual private network router with a single malformed packet. The denial-of-service vulnerability was reported by Internet security testing company NTA Member Ltd. and affects several Nortel VPN routers. NTA called the vulnerability "serious." Nortel gave it "major priority" status.

Infosys, Alstom Plan R&D Center

Infosys Technologies Ltd. and Alstom SA are jointly opening a research and development center in Bangalore, India. Paris-based engineering company Alstom plans to spend about \$20 million on research at the R&D center over three years while growing the staff to 300. Infosys staffers will run the center and provide the infrastructure.

HP Unveils Three Thin-Client Devices

Hewlett-Packard Co. has unveiled three thin-client devices that can provide basic computing power for low-end users while letting IT maintain control over the systems. The three Compaq T5000 devices - priced from \$230 to \$390 - are cheaper than HP's low-end PCs. They will be available this month.

Tibco Issues Q1 Results Warning

Tibco Software Inc. warned that its revenues and earnings were lower than expected in its just-ended second quarter, marking the second quarter in a row the company has fallen short. Three other major large deals didn't close before the quarter ended on May 27, and it now expects revenue for the period to be \$200 million to \$202 million versus its \$208 million projection.

ON THE MARK

New Infrastructure Lurks Behind . . .

... the rush to service-oriented architectures (SOA). And it won't be just more software. A new layer of hardware ultimately awaits IT managers who deploy Web services, which depend on XML messaging. "We need a network that knows how to handle

messages, not just packets," insists Eugene Kuznetsov, chairman and chief technology officer of DataPower Technology Inc. in Cambridge, Mass. Next quarter, DataPower will ship its yet-to-be-priced XML Concentrator chassis, which is laden with blade computers that use specialized message processors to accelerate XML performance and supply security and quality-of-service policies. Kuznetsov acknowledges the expense and headaches of adding another hardware layer inside most corporate networks, which is why DataPower is targeting Internet service providers with XML Concentrator. Service providers will be able to charge you a pretty penny for processing XML messages - pennies you'll be glad to part with just to avoid managing more IT gear.

Wayne Ariola, vice president of corporate develop-

ment at Parasoft Corp. in Monrovia, Calif., agrees that specialized hardware for message handling is inevitable. He says a full-blown SOA infrastructure is coming because of the technology's success. "The early adopters are gone, and we're off to the races," Ariola says. He claims that many companies in the race have wound up on Parasoft's doorstep because of its SOAPtest development tools. Version 4.0 ships this week, adding improved security- and penetration-testing tools. For example, you can check if your application's code is susceptible to XML bombs (messages that continually call themselves until a system's RAM is overloaded) or determine if your SOA approach complies with Web services standards.

SOAPtest 4.0 starts at \$3,995.

Migrate Visual Basic apps to Linux . . .

... and Macintosh clients with the touch of a button. REALbasic 2005 imports VB code and compiles versions of the program for Linux and Macintosh users. The integrated development environment from Austin-based Real Software Inc. needs few third-party plug-ins in its final form for Windows and Mac systems and goes into beta for Linux. The Linux version will be ready for release by month's end. According to CEO Geoff Perlm, VB users who need to deploy their work on non-Windows systems no longer have to worry about virtual machines or managing Dynamic Link Libraries, because REALbasic handles those details and more. The new release adds about 100 features, such as a tabbed browser and the open-source SQLite database, and costs \$395 for the Professional Edition. Perlman suggests that REALbasic also will appeal to VB coders who are unhappy with Microsoft Corp.'s forced march toward Visual Basic .Net. "VB .Net is radically different than VB 6 for most users," he says.

Hercules ships as software or as . . .

... part of an integrated application. Citadel Security Software Inc. in Dallas this week releases an appliance version of its Hercules 4.0 vulnerability management tool as an al-

ternative to licensing the software by itself. Hercules gathers asset data from a dozen or so network-scanning products, finds system vulnerabilities and then remediates those security lapses. Carl Banzhof, chief technology officer at Citadel, says IT focuses too much on patching software defects, which reflect only 20% to 30% of all vulnerabilities. Unsecured accounts, unnecessary services, back doors and misconfigurations of systems account for the majority of the problems, Banzhof says. In addition, Hercules 4.0 adds risk analysis reporting so users can prioritize fixing vulnerable devices. Software licenses for Hercules 4.0 start at \$28 per device. The HS1500 appliance, with the software, carries a \$1,000 monthly subscription fee plus per-use charges.

Now that the "Q" word no longer . . .

... needs to be whipsawed by users weighing possible outsourcing moves [QuickLink 54064], Artifact Inc. CEO Mark Westler contends that IT executives should start thinking like their peers in manufacturing. Software development is largely specialized and repeatable and thus could be automated, he argues. An application development supply chain "is emerging underneath our feet right now," he says, so much of the work should be outsourced to the best supplier for a given task - either onshore or off. All IT needs is "visibility and control" throughout the app development process, he claims. Baltimore-based Artifact offers an online service that gives IT managers dashboard views of the state of an application's development. Pricing starts at \$500 per project. © 54778

Artifact's vulnerability management appliance

> With Sprint, ING DIRECT is beautiful.

With 99% of their transactions taking place over the Internet or on the phone, ING DIRECT's customers don't go to the bank. The bank goes to them. That's why ING DIRECT turned to Sprint for a complete telecommunications solution that addresses their unique security and reliability needs. The Sprint Peerless IP Network made it possible for ING DIRECT to integrate call center and Web traffic over a single, private network — one with absolutely no connectivity to the public Internet. And since then, they've experienced zero service interruptions. When every customer can be the first customer in line, banking is beautiful. With Sprint, business is beautiful.™

HP Users Say NonStop Servers Will Need Long-Term Support

Current models are still expected to be in use beyond planned 2013 cutoff date

BY PATRICK THIBODEAU

HEWLETT-PACKARD Co. last week said it will continue to support its existing MIPS-based NonStop servers through 2013, despite a plan to begin shipping Itanium-based models next month. But some users of the fault-tolerant systems think HP may have to extend the support even beyond that far-off date.

In an era when commodity servers are routinely replaced within three to five years, users and consultants say that NonStop systems running mission-critical transaction-processing workloads typically stay in production for seven to 10 years. And there are stories of machines remaining in operation for 15 or more years.

HP will sell the NonStop hardware, which is based on processors from Silicon Graphics Inc., until the end of 2008. Users who continue to buy those systems over the next several years may need support longer than HP now plans, said Neil Clark, a systems consultant manager at Gallagher Bassett Services Inc., a risk and claims management company in Itasca, Ill.

"Offering support for only five years after selling a system doesn't seem long enough," Clark said.

His point was backed up by Carby Meurer, the Tandem

technical services manager at U.S. Foodservice Inc.'s national processing center in Phoenix. Meurer said she expects that many users will run MIPS-based NonStop systems beyond 2013 and that HP will continue to support them.

"Tandem" refers to Tandem Computers Inc., the company that developed the NonStop line prior to being bought by Compaq Computer Corp., which HP later acquired.

Meurer, who heads a regional group of Tandem and NonStop users within the ITUG user organization, said there have never been any questions raised about HP's ongoing

support of the systems. "New products and features — maybe," she said. "High maintenance costs — probably. But maintenance nonetheless."

Some companies, especially ones that are running high transaction volumes, such as Chicago Mercantile Exchange Holdings Inc. and Bank-Verlag GmbH in Cologne, Germany, plan to quickly begin adopting the new Integrity NonStop line because of the performance improvements expected from Intel Corp.'s Itanium 2 chip. HP formally announced the Integrity models last week (QuickLink 56647) and said they can run up to 2.5 times faster than existing models.

But many other users will likely wait for later releases before switching to the Integrity

line, said Mike Kilpatrick, a NonStop consultant in Dyer, Texas. "Unless that box has been out in the field for any time, it's hard to say how reliable it will be," he noted.

HP officials said they expect the old and new systems will be run side by side in many cases. "A lot of customers will have coexistence for a long time," said Randy Meyer, HP's director of enterprise storage and servers.

One user that already has migrated applications off an older NonStop to an Itanium-based system is Bank-Verlag, which processes records and ensures regulatory compliance for some 300 banks. Wolfgang Breidbach, technical director of NonStop systems, said the migration took one IT worker only a couple of days. ☐ 54828

Integrity NonStop

- Supports up to 4,080 Itanium 2 processors.
- Is rated for 99.999% hardware availability.
- Can run 29 years on average without scheduled downtime.
- Is compatible with HP's existing NonStop S-series models.
- Pricing starts at about \$400,000 but is highly dependent on user configurations.

3Com, HP Expand Switch Offerings

BY MATT HAMBLEN

3Com Corp. and Hewlett-Packard Co.'s ProCurve networking unit will separately announce new switches and software products today, expanding their support for building security and management tools into corporate networks.

3Com is introducing a family of 12 stackable switches, primarily for use at the edge of networks. It's also adding two switches with modular chassis to its Switch 7700 family, plus software designed to support endpoint security and configuration of networks that include equipment from 3Com and other vendors.

HP will roll out a switch that supports multilayer routing at the core of a network, as well as no-cost software enhancements intended to improve the security and mobility of devices connected to its ProCurve 5300i series of network edge switches. HP also plans to announce up-

graded network management and wireless access point software.

Mark Berkhimer, a potential customer for 3Com's new stackable Switch 5500G devices, said they could be used

New Switches

to create a core switching network "with all the bells and whistles, without the outlay [for] a large chassis."

Berkhimer is an IT manager at the Susquehanna Area Regional Airport Authority, which operates Harrisburg International Airport and two other airports in Pennsylvania.

A Cure for Most Needs

The 5500G is another enterprise-class offering resulting from 3Com's joint venture with China-based Huawei Technologies Co. Berkhimer noted that it could stack up to eight 5500Gs, with a total of as many as 384 ports, to act as one switch. "That will cure most user needs," he said.

Analysts said that the new security and management products and upgrades are part of an ongoing trend by switch makers to incorporate such tools for networking. "It's become [basic] to have some kind of security in switching," said Steve Schuchart, an ana-

lyst at Current Analysis Inc. in Sterling, Va.

HP's new ProCurve Routing Switch 9400i series supports IPv6 and offers up to 32 ports for 10Gb/sec. routing of data, said Al Madden, the company's Americas product manager for ProCurve.

Schuchart said one of the 9400i series' needs is to follow how the product evolves because it's based on the BigIron MGB switch built by Foundry Networks Inc. Foundry isn't expected to provide further upgrades for the switch, he added. However, HP said there will be support and upgrades for the 9400i series.

In addition, HP plans to roll out new switching technology in the fall that will involve a core network device with less intelligence built in and more distributed to devices at the network edge, Schuchart said. The new concepts are based on technology that HP acquired from Riverstone Networks Inc. last June.

Madden wouldn't say whether the 9400i was developed by Foundry. ☐ 54829

Oracle Revises Solaris 10 Licensing

Oracle Corp. has changed licensing terms for users that run its database on Sun Microsystems Inc.'s Solaris 10 operating system, revising a model that analysts said put Sun at a competitive disadvantage with Hewlett-Packard Co. and IBM. The changes lower licensing costs for Solaris users running Oracle software on only part of their servers, a practice called partitioning.

Nortel Reports Loss On Slight Sales Rise

Nortel Networks Corp., recovering from an accounting scandal and an industry downturn, reported a first-quarter loss on sales that rose slightly from last year.

| Nortel Networks Corp. (NOR) | |

| \$2.54B | (\$49M) |
| \$2.44B | \$59M |

Quest Buys Vintela For \$56.5M In Cash

Irvine, Calif.-based Quest Software Inc. has agreed to acquire privately held Vintela Inc. for approximately \$56.5 million in cash. London, U.K.-based Vintela makes tools that offer Microsoft Corp.'s Active Directory and Symantec Management Server to systems computing environments that include both Windows and non-Windows platforms. The deal is expected to close this summer.

Fed Agencies Eye RFID Technology

Some U.S. government agencies are testing radio frequency identification technology as a tactic to save money and improve services. In a report, the Government Accountability Office said it found that 33 of 34 federal agencies are implementing or exploring RFID initiatives for a number of uses, including logistics support, shipment tracking and border patrol.

Tablus, PortAuthority Unveil Security Tools

Updates aim to boost protection against data thefts

BY JAIKUMAR VIJAYAN
TWO new content-monitoring tools to be released this week will add to the growing number of options for security managers looking to protect sensitive data against compromises and theft.

Tablus Inc. in San Mateo, Calif., and PortAuthority Technologies Inc. (formerly Vidius Inc.) will both release updated versions of their respective technologies this week.

Tablus' upgraded hardware and software platform features a component called Content Alarm NW 2.0 for monitoring and blocking information leaks via the network and a component called Content

Alarm DT 2.0 that's designed to do the same at the desktop level. The company touts it as the first content monitoring product designed to prevent data leaks at both the network level and at the desktop.

The product uses Google-like crawler technology to identify and "fingerprint" sensitive data such as financial or personal information. On a network, the Tablus tool monitors traffic to ensure that the fingerprinted data is not illegally transmitted out of the network via e-mail, instant messaging, FTP or any other means, said CEO Jim Petric.

A similar approach is being applied on the desktop side to ensure that users can't illegally modify, copy, delete or save protected data on thumb drives, external hard disk or private e-mail spaces, he said.

Such capabilities are critical for protecting sensitive data, said Dmitry Kalita, IT director at Amide Pharmaceutical Inc., a manufacturer of generic drugs in Little Falls, N.J. Amide's network had long

formulation information that is relatively easy to print out or download and split into devices such as USB thumb drives, external storage devices, Kalita said.

"With Tablus, I can control what happens to the files," he said. "It does not allow anybody to do anything unless they have permission."

Data Recognition Corp., a Maple Grove, Minn.-based provider of educational testing and assessment programs, is using Tablus' network monitoring technology to protect test booklets, answer keys, scores and similar information, said Michelle Edenborn, the company's IT director.

All information that is transmitted out of the company's network is inspected for sensitive data by Tablus' ap-

pliance, she said.

Meanwhile, Beverly Hills, Calif.-based PortAuthority is enhancing its content monitoring product, PortAuthority for Internal Mail, with a function for scanning internal e-mails for signs of data misuse. The product, which already allows companies to monitor external e-mails, adds support for Microsoft Exchange 2003 internal

in Tablus Content Alarm NW 2.0 and Content Alarm DT 2.0. Real time network traffic analysis, linguistic analysis of both structured and unstructured data, and Google-like crawler technology for creating digital fingerprints of data. Designed to protect sensitive data on both network and desktop levels. Pricing starts at \$25,000 for the departmental edition. The enterprise edition starts at \$75,000.

in PortAuthority for Internal Mail. Designed to prevent leaks of confidential information between Internal e-mail users. Supports Microsoft Exchange 2003, Lotus Domino and Exchange 2000.

Informix Users Want More From IBM

BY MARIO L. SONOHEM

IBM is trying to reassure customers who fear that the perception that the Informix database is a dead product will continue to grow and eventually become reality. IBM bought the Informix technology in 2001 to boost its presence in the distributed database market and better compete against rivals Oracle Corp. and Microsoft Corp.

While few Informix customers interviewed last month at the International Informix User Group (IIUG) conference and elsewhere said IBM is responsive to their development needs, some fear a continued lack of visibility will lead to more independent software vendor defections and stronger efforts by IBM's sales force to convince users to replace Informix with DB2.

Ironically, some DB2 users recently criticized IBM for neglecting their product [QuickLink 54664].

The concerns come as Garner Inc. released a report showing a decline in Informix sales during 2004 and noting that key IBM partners such as Computer Associates International Inc. have said that they won't support future versions of Informix.

Prevailing Perception

"The world has a perception that Informix is dead," said Stuart Liefel, president of the IIUG and chief technology officer at Informix reseller Kaser Corp. in Lee's Summit, Mo. He blamed that partly on IBM's postacquisition plan to create a "merged product."

Several users criticized IBM's database sales force as overly DB2-centric. "It's almost like they are satisfied in supporting the Informix product line for the current user base but do not want to risk possible sales of the Informix line affecting their DB2 revenue," said Clifford

e-mail and for ISA 2004 Web proxy servers.

"There is definitely growing interest" in tools such as these, said Dan Keldsen, an analyst at Delphi Group, a Perot Systems Corp. company in Boston. Compliance issues and fears of data loss are driving much of it, he said.

Also, network security vendors traditionally haven't paid a lot of attention to content protection and issues such as inappropriate use of information by insiders, which vendors of content monitoring tools are beginning to address, Keldsen said. □ 54622

Beas, a database consultant at a company that he asked not be named.

One database administrator from a hospitality company, who also asked not to be named, said he was disappointed Informix Dynamic Server Version 9A. He said there have been some attempts by salespeople to introduce DB2 into his shop.

Kervyn Schneider, a business intelligence architect and IIUG member, said that after the postacquisition departure of most of the Informix sales force, "I think many in the Informix community feel we are the stepchildren."

Bruce West, program director at Informix, said IBM is holding road shows and online events to let customers and developers interact. This year, the company will start to focus on grass-roots marketing among partners to make them "aware of the viability of Informix," he said. □ 54606

Israeli Police Uncover Trojan Horse Spy Ring

Israeli police have uncovered a major industrial spy ring that allegedly used Israeli horse software to snoop into some of the country's leading companies.

A husband-and-wife team, Michael Harphratz and Ruth River Harphratz, was detained last week in London on suspicion of creating the Trojan horse program. The software was sent via e-mail or computer disks to people at targeted companies, and was then used by computers to harvest confidential information from the infected PCs, according to a report in the *Haaretz* newspaper.

The Tel Aviv-based newspaper detailed how a wide range of businesses, including television, mobile phone, automotive and utility companies, allegedly used the Trojan horse to obtain "reels of thousands" of pilfered documents.

Police told *Haaretz* that the companies started using the malicious software after engaging the services of any one of three private investiga-

An International IT News Digest

tion agencies, which were given the task of carrying out the industrial espionage. The newspaper reported that another 21 people have been detained for involvement in Israel.

U.K. Biometric Test Finds Scanning Glitches

LONDON

THE U.K. GOVERNMENT has introduced a bill to create a biometric identity card system by 2010 to help fight terrorism and fraud, after it shelved the measure before last month's general election (*QuickLink* 5/29/05). It also released a report describing what officials called "nervous problems" with the technology.

The report on the U.K. Passport Service's eight-month trial of biometric technology, which involved 10,000 people, cited problems with scanning large fingers and the eyes of people with dark complexions, for example.

Of the three methods tested, facial scanning had the lowest verification success rate, espe-

cially in bad lighting; the study found fingerprint scanning had a better success rate, but the report said the scanner surface was "too small to scan a sufficient area of fingerprint from participants with larger fingers." Eye scanning was the most accurate, but the machines had difficulty scanning the irises of people with dark complexions and people over the age of 90, according to the report.

Japan Aims for FLOPS in Supercomputer Race

TOKYO

JAPAN THIS MONTH will begin a research effort to build a supercomputer capable of crunching numbers about 30 times faster than today's fastest system, says the country's government said last week.

Japan's Ministry of Education, Culture, Sports, Science and Technology has established a program with NEC Corp., Hitachi Ltd. and several Japanese universities to develop by 2011 a supercomputer that can perform more than 3 quadrillion floating-point operations per second, or 3 PFLOPS. "We predict that IBM's Blue Gene/L or its successors will be working at about 3 or 4 PFLOPS around 2010. Our target is to be at least the same speed or faster," a ministry official said. ■ **54777**

Briefly Noted

Transmeta Corp. in Santa Clara, Calif., said last week that it has agreed to sell its Crusoe line of microprocessors to Culvercomm Technology Ltd. in Hong Kong for \$15 million in cash. Transmeta announced in late March that it would exit the chip-making business after failing to break into the market for notebook PCs (*QuickLink* 5/3/05).

■ **PAUL KALLENDER** **IOG NEWS SERVICE**

Deutsche Telekom AG, Europe's largest telecommunications service provider, last month named 46-year-old Peter Thomas Sany CEO, effective Sept. 1, and said he will be in charge of information management and processes. The Bonn-based company also named its first chief technology officer, Anton Hendrich Schmidt, 51, who will be responsible for technology and innovation activities starting June 16.

■ **JOHN BLAU** **IOG NEWS SERVICE**

Depron AG, a large specialty chemicals company in Osnabrück, Germany, has selected AT&T Corp. as its worldwide data network provider under a five-year contract valued at \$45 million. AT&T announced last month.

New Tools Aim to Extend Business Intelligence

BY HEATHER HAVENSTEIN

Business intelligence is continuing its march toward the masses as new tools emerge to provide front-line enterprise workers with access to operational data, easing daily decision-making processes.

San Jose-based Business Objects SA this week is planning to unveil a set of tools that will let users of its BusinessObjects XI platform embed analytics capabilities in business processes.

Meanwhile, the Ottawa-based Eclipse Foundation this week will announce the first version of an open-source tool for building operational BI into Java applications.

"The Business Objects tool set, called BusinessObjects XI Built for Operational BI, includes process tracker and analyzer tools that allow users to connect to operational data sources like Web services, Microsoft's .Net, data objects and data streams, executives said. Pricing for both tools starts at \$10,000.

Oscar Vasquez, director of enterprise architecture at medical transportation company AMR Inc. in Denver, said the new Business Objects tools could help him align ambulance dispatchers, drivers and paramedics by providing analytics capabilities in those workers' processes.

"We've got workers on the supply side and the demand side, [and] they don't often see eye to eye because they are not looking at the same information," Vasquez said. "If our front-end dispatchers understand we are approaching a service-level agreement, they will dispatch things differently or more quickly."

AMR plans to roll out the XI software in September.

Jonathan Rothman, director of data management at Emergency Medical Associates (EMA) in Livingston, N.J., said the new tools could provide templates to make it easier to embed BI analytics in processes. EMA, which is running XI in test mode in parallel with an older version of the Business Objects platform, has already launched operational BI to infuse the dashboards

in hospital emergency rooms with information to feed metrics on admission and discharge times and other treatment-related thresholds. Rothman said.

The new tools could make it easier to extend operational BI capabilities by embedding analytics in processes for finance, accounts payable and billing users, he added.

Eclipse Unveils BIRT
For its part, Eclipse announced that Version 1.0 of its Business Intelligence and Reporting Tools (BIRT) project is now generally available.

BIRT, whose beta-test version has been downloaded 9,000 times since February, according to Eclipse executives, is designed to allow Java developers to easily integrate operational BI and reporting capa-

bilities with Java applications.

Actuate Corp. is launching Actuate BIRT this week to provide fee-based support, maintenance and implementation services for BIRT. The services are priced from \$35,000.

Stavros Kouzas, a developer and co-founder of Osmosis Network and Consulting in northern Greece, said his company is using BIRT to build reports for its Eclipse-based desktop applications, mainly because it allows the reports to be distributed over the Internet.

However, he added that BIRT is not as mature as some other commercial BI design products he has worked with in the past and that it has some bugs related to the way the designer tool handles database connections. ■ **54819**

The new tools could make it easier to extend operational BI capabilities by embedding analytics in processes for finance, accounts payable and billing users, he added.

Eclipse Unveils BIRT

For its part, Eclipse announced that Version 1.0 of its Business Intelligence and Reporting Tools (BIRT) project is now generally available.

BIRT, whose beta-test version has been downloaded 9,000 times since February, according to Eclipse executives, is designed to allow Java developers to easily integrate operational BI and reporting capa-

bilities with Java applications.

Actuate Corp. is launching Actuate BIRT this week to provide fee-based support, maintenance and indemnification services for BIRT. The services are priced from \$3,500.

Stavros Koukalis, a developer and co-founder of Omnisia Network and Consulting in northern Greece, said his company is using BIRT to build reports for its Eclipse-based desktop applications, mainly because it allows the reports to be distributed over the Internet.

However, he added that BIRT is not as mature as some other commercial BI design products he has worked with in the past and that it has some bugs related to the way the designer tool handles database connections. ■ **54810**

Sun

they're going to go with it." "It's pretty interesting that a server vendor decided to spend over 50% of their [available] cash to purchase a storage company," noted Ed Dobson, a systems architect at Dartmouth College in Hanover, N.H. "What I get from that is they're definitely going to take another look at their storage strategy."

Dobson, who uses Sun disk storage systems and StorageTek tape libraries, said he hopes the deal will help him better integrate his back-end storage, subsystems, and improve service levels.

But Daniel Grim, executive director of network and systems services at the University of Delaware in Newark, is wondering what Sun will do with StorageTek. Grim said he recently heard from Sun representatives extolling the virtues of Hitachi's products, "and that's why I'm perplexed about what their strategy really is going to be now."

HOW SUN AND STORAGE TEK MATCH UP

Sun Microsystems Inc.

Primary products: Unix-based servers, workstation computers, storage subsystems

EMPLOYEES: 35,000

2004 REVENUE: \$11.18 billion

LAST YEAR'S SALES: -2.2% compared with the previous year's

2004 NET LOSS: \$386 million

The university is a heavy user of Sun's UltraSparc systems but buys its RAID storage devices from U.K.-based Netext Ltd.

Joel White, lead IT architect at Allstate Insurance Co. in Northbrook, Ill., said he has a number of questions for Sun executives, not the least of which is how the company will deal with overlapping products after it completes the StorageTek acquisition.

Mark Canepa, executive vice president of Sun's network storage products group, acknowledged some product overlap, particularly at the midrange level. But rationalizing that "will be pretty sim-

Storage Technology Corp.

Primary products: Automated tape storage systems and disk storage subsystems

EMPLOYEES: 7,200

2004 REVENUE: \$2.22 billion

LAST YEAR'S SALES: +19% compared with the previous year's

2004 NET INCOME: \$191 million

ple," he said. "I think we're going to be able to realign and reorganize people in order to get what's needed done."

Arvind Thapar, chief technology officer at First National Bank of Omaha, which is a StorageTek user, said he sees the planned acquisition as a move by Sun to "catch up" with IBM, HP and other major vendors that offer more-complete product lines. Thapar added that he doesn't expect the deal to affect First National's IT systems.

Sun CEO Scott McNealy said during a conference call that combining the two companies brings them to a "whole new level of scale and scope

on a global basis." The merger will boost Sun's sales force by more than 1,000 people and add thousands of service and support personnel, McNeely said. He added that there are no significant changes planned in the product road maps of the two companies.

'A Step Backward'

However, Chris Foster, a storage analyst at Technology Business Research Inc. in Hampton, N.H., said the deal is likely "a step backward" in Sun's effort to boost its IT services business. "I expected Sun to make an acquisition in professional services or software," he said. "I don't think StorageTek fits that profile."

Judith Hurwitz, an analyst at Hurwitz and Associates in Waltham, Mass., said Sun had to do something to reinvent itself. "Clearly, the marketplace has said to them: 'Not that interesting'" when looking at Sun's traditional Unix hardware. Hurwitz said, "Can

[buying StorageTek] work? I'm not sure. What I don't see is a cohesive, clear plan behind it."

But John McArthur, an analyst at IDC in Framingham, Mass., said he's "very positive" about the acquisition, despite Sun's previous difficulties in integrating other storage vendors that it has acquired. Sun has shelved out more than \$1 billion to purchase companies such as Incore Computer Corp., MaxStrat Corp. and Red Cape Software. McArthur blamed its integration problems on the fact that those firms lacked significant installed bases.

Sun has a better chance of success with StorageTek, McArthur said, describing the new deal as "less sexy but a heck of a lot healthier" than some of the company's previous acquisitions. **E 54817**

Reporters Patrick Thibodeau and Todd R. Weiss contributed to this story.

Sun Storage Chief Talks About StorageTek Acquisition

Mark Canepa, executive vice president of Sun Microsystems' network storage products group, will be overseeing the \$4.1 billion buyout of StorageTek and will likely lead that company once it becomes a part of Sun. Canepa spoke with Computerworld about how Sun will address StorageTek users' concerns around service and support and product synergies.

Why buy StorageTek?

It was very clear that for Sun to be a complete end-to-end player in the data center, we had to go solve the data [storage] part. At Sun, we've been talking about doing a lot more in the managed services arena, but it's always been around managing our own stuff. Now we can become a lot more

bulletproof around heterogeneity as part of our managed services capabilities.

Analysts have said that you've had some major merger failures over the past few years and that your executives don't take advice from outsiders. How do you respond to that? There's got to be a balance. I spend a lot of my time out there talking to the analyst community and listening to the analyst community. I take

their advice, and then you have to blend their input with the other variables to do what we think is in the best interest of executing an overall Sun strategy.

Will you keep these two companies separate? Are you going to try to integrate them

right away? What's your road map? It's too early to really be able to talk about it. Over the next few months, we're going to start to flesh this thing out.

What do you say to StorageTek users? How do you alleviate their concerns that their services and support will be hurt when their vendor merges with Sun? If there's a set of best practices StorageTek has, we're going to learn from that. If there's a set of best practices that Sun has that StorageTek can learn from, we're going to have them learn from those.

HP Reseller Pacts in Peril, Some Say

THOUGH THEY DISAGREE on the timing, analysts test work said the buyout of StorageTek by Sun Microsystems will likely force the cancellation of the former's reseller agreements with Hewlett-Packard.

Brian Babineau, an analyst at Enterprise Strategy Group, said he thinks it's likely that Sun and HP will drop its agreements with StorageTek once the buyout is complete. "I've got to be level that if you're HP and you have other choices for tape vendors... you may be able to retoolize changing your entire tape portfolio without having StorageTek in the mix," he said.

Shelly Seyfarth, an analyst at Merrill Lynch & Co., agreed that HP will shut suppliers but predicted that the change will occur over a longer period. In the near term, she expects HP will stick with StorageTek and Sun as it seeks to revitalize its storage business.

Enterprise Strategy Group estimates that 5% to 7% of

StorageTek revenue is currently

derived from HP reseller sales. Babineau said he believes that Sun, Jose-based Quantum Corp. and San Diego-based Overland Storage Inc. have an opportunity to take over StorageTek's reseller business.

Patrick Ertelbacher, director of marketing at HP's StorageWorks division, said both Sun and StorageTek last week assured him that the companies will continue to support any existing reseller agreements.

Nonetheless, the deal caught HP off guard. "I haven't found anybody inside HP who wasn't surprised. I think everybody expected Sun to go into the software direction. The tape market is... declining right now," said Ertelbacher.

Brenda Zawatski, general manager of StorageTek's information life-cycle management group, said, "We don't anticipate any changes in our OEM agreement."

Believing in Blogs

WHEN YOU GOT last week's issue, chances are you read Patrick Thibodeau's Page One story about IT blogging being one-sided, with vendors adopting

the medium much more assertively than users. And, like I was, you were probably struck by the comment of the Sun Microsystems executive, referring to the prospect of IT managers getting into it: "If a few of those guys started doing [blogs], you can darn well bet that we would be reading them."

That's a pretty safe bet, and it speaks volumes about why it's so unfortunate that corporate IT leaders appear to be so skittish about blogging. CIO blogs would command the attention of vendors across the IT board that would be eager to find out what their customers and prospective customers are saying about them and their competitors. Your expectations, demands, grievances and successes would be analyzed up one side and down the other — the subject of vendor staff meetings and strategy sessions, with you in the virtual director's chair.

Now don't get me wrong — my focus on the user side of the equation isn't intended to diminish for a heartbeat how impressive it is that several large IT vendors are encouraging their employees to blog. There appears to be a genuine interest on the part of vendors like Sun, Microsoft and IBM to establish a dialogue between their employees and their customers, and to do it with minimal restrictions.

It takes courage to do what these vendors are doing, because clearly there's a risk that bloggers will convey information that sheds a negative light on the company or create

confusion in the market. A prime example of the latter occurred last August when Sun President Jonathan Schwartz, a loose cannon if ever there was one, made a statement in his blog that was widely interpreted as an indication that Sun was considering a plan to acquire Novell. And then there's the concern about bloggers

airing dirty laundry. After all, that's a standard raison d'être of blogs. I can cite an example of that as well — one that hit mighty close to home.

In October 2003, I read in Screenshots, a blog site in Malaysia run by a guy named Jeff Ooi, an apology by the editor of the Hong Kong edition of *Computerworld* for having plagiarized another writer. The admission and apology came only after Ooi had exposed the plagiarism in his

blog. You have no idea how much I hated reading that.

I worked at *Computerworld Hong Kong* from 1990 to 2000 and served as the editor for more than eight of those years. During that time, a lot of very talented, dedicated people worked tirelessly to build that publication into what was unquestionably the premier IT newspaper in Asia. And in the blink of an eye, this idiot trashed everything we had done. I said as much in a blog entry I submitted to Ooi's site. I also commended him for exposing it and encouraged him to keep the beat on. As much as I hated what had happened, I damn well had a big fan of blogs that day.

That's why I'm especially gratified by the launch last week of a new blog area on our Web site [Quick-Link #5920]. I'll be joining other *Computerworld* editors and guest bloggers in an aggressive effort to expand our delivery of compelling content to you and your peers.

Here's hoping the blogging momentum will build. And that your company will help build it. **© 54781**

BRUCE A. STEWART

The Case for The Portfolio Business Case

ARE YOU FINDING it more difficult lately to construct a good business case? Infrastructure managers are probably screaming, "Late! For years!" But now it's becoming more difficult for development teams, too.

Part of this was caused by the "big package" revolution of the last decade. Getting every department that uses an ERP package, for instance, to contribute its portion of the upgrade costs is a hassle for most IT managers, especially when they hear, "We didn't ask for this, so we're not paying for it."

Now, other factors are starting to appear. Service-oriented architectures are a brilliant idea for advancing enterprise flexibility and speed to market. But they are a nightmare when it comes to tracing a stream of benefits in a department and tying them to the costs of common code.

It's time to rethink the business case, because the application as we've known it is dying and being replaced by a mix of infrastructure and middle layers with a little application code on top. Rather than a monolith that can be justified — and upgraded — as a unit, we have many moving parts, all on their own upgrade cycles.

Better CIOs have seized upon portfolio management to help them deal with reinvestment questions. The best among them have moved even beyond that to looking at the portfolio and the business value it supports as a whole and then making investment decisions to manage the top line (by increasing value generated) and bottom line (by decreasing the cost to deliver that value).

Rather than have each project justify itself, savvy CIOs ensure that the complete portfolio — investment and re-

investment — maintains a desired rate of return.

Coupled closely with this notion is the idea that qualitative business value — the gains you expect to be there but can't clearly quantify — counts. Customer gains yield a revenue impact, hence a top-line gain in value for the portfolio, regardless of the cause. Likewise, it's the overall profile of the infrastructure supporting the business that matters, not whether one part of it is experiencing a temporary cost bubble due to upgrades.

If this sounds to you as though the CIO is running IT just as the business is run, you're right. Organizations must invest in themselves just to hold their market positions. They must develop new products and take the risk that the investment won't pay off. They must periodically replace worn plants and equipment, refurbish customer points of presence and match competitive customer-service initiatives. This holistic view is precisely what modern IT systems demand.

Some of the problems the portfolio approach solves include:

- How do we justify changes we're making to support our enterprise architecture?
- Where's the business value in reducing complexity, especially when it'll take years?
- How do we replace the old version of that core package when the clients don't want to pay for it?
- How do we justify infrastructure upgrades when there aren't enough new applications coming onstream to pay for them?

When you can say to a recalcitrant business peer, "We're doing this because it increases my ROI by 25%, and I'm not telling the CEO I'm leaving that money on the table," that's CIO power.

It's also a good way to demonstrate you're ready to run a business, not just IT. ☐ 54702

THORNTON A. MAY Companies Striking Out On Strategy

THE PROCESS for making and executing strategy in most organizations is broken. Conversa-

tions with business school faculty colleagues conducting research on companies based in Canada, Mexico and the U.S. indicate that 70% of 300+ of enterprises fail to successfully execute their strategies. The decisions facing executives today truly do matter and will set the course for the next decade. Existing strategy-making and strategy-executing processes appear woefully unskilled to meet the challenge.

The IT Leadership Academy, drawing on research and executive interviews conducted at the CIO Executive Summits in New York and Southern California and at the CIO Boot Camp in Las Vegas, created a strategy diagnostic that parsed the world into four categories of organization:

1. **Right strategy, right execution:** 20%
.....
2. **Right strategy, wrong execution**
(in part): 10%
.....
3. **Wrong strategy, right execution:** 20%
.....
4. **Wrong strategy, wrong execution**
(in part): 50%

This frightening data set motivated us to look closely at the conventional wisdom at work regarding making and executing strategies. The first thing we did was recheck the numbers. Could the practice of strategy truly be as bad as the numbers indicated?

gy occurs when people outside the organization can't figure out what your strategy is.

We asked employees in the CIOs' chains of command whether the stated strategies of their organizations materially affected their day-to-day work-place behaviors. More than 70% said they did not. While the top of the house might be in alignment regarding strategy, the people at the oars frequently are not. Perfect pictures of the future don't do anybody any good if they don't change behaviors. Strike 2 for strategy occurs when the behavior of people inside the organization isn't driven by strategy.

Conventional wisdom (a wonderful phrase first coined by John Kenneth Galbraith in *The Affluent Society*) has it that strategy and strategists have bounced back from a near-death experience in the 1980s, a coma during the whole dot-com boom-and-bust era, and the recent episode of

carnivorous cost control. Strategy is very much back on the executive agenda. Unfortunately, senior executive behaviors regarding strategy-making and strategy-executing are all over the map.

In their very readable *Strategy Maps: Converting Intangible Assets Into Tangible Outcomes* (Harvard Business School Press, 2004), Robert S. Kaplan (my former professor) and David P. Norton (my former boss) provide a very understandable definition of strategy: "Strategy is based on a differentiated customer value proposition. . . . Strategy requires a clear articulation of targeted customer segments and the value proposition required to please them. Clarity of this value proposition is the single most important dimension of strategy." Strike 3 for strategy comes when organizations don't keep this very simple definition in mind.

As a futurist, I believe that all signs indicate that we have emerged into what tomorrow's business historians could term a strategic era, an era when firms have a big choice about their future evolution. Understanding and fixing broken strategy-making and strategy-executing processes will be a big part of determining whether that future is one you will enjoy. ☐ 54735

READERS' LETTERS

The End Is Not Near for Corporate IT

DISAGREE WITH Nicholas Carr ("The End of Corporate IT," *QUICKLINK* 5/30/95). He states that smaller companies will find it difficult to buy their own systems, but in reality, prices are falling so that now even individuals can afford to buy computing power and storage.

Also, IT is not nearly as commodity-like as electricity. The major cost of IT at the moment and in the foreseeable future is application development and implementation of company-specific business logic. The cost of hardware and even software is a tiny fraction compared to this. Obviously, certain business architectures become standard and it makes no sense for a company to develop them on its own. The company may use a third-party "utility

company," for example, to store and secure large amounts of data. Still, it would be difficult to "utilize" company-specific logic and intellectual property.

Daniel Nevedrov
Senior software engineer,
Superior, Colo.
daniel_nevedrov@hotmail.com

I THINK CARR MISSES one important point: While electrical generation equipment moved to utilities, the machines used to produce the goods did not. Which parts of our IT infrastructures are a direct part of product delivery, and which are supply chains, memory and reports?

Bob Hayes
First vice president, enterprise
architecture, ARN AMRO

Services Co., Chicago
Bob.Hayes@arnamro.com

COMPARING COMPUTING to power generation is like comparing apples and oranges. Having been a victim of ASP usage gone wrong, I can tell you that for most business-critical apps, there is no way a company can rely on Internet-based outsourced services. The delivery is slow and sometimes nonexistent, and you still require most of the same infrastructure as if you provided the services for yourself (unless power generation). There are some niches that these services can fill, but I wouldn't depend on them for running businesses or mission-critical applications ever again. It costs us less productivity, and now we don't own the data produced by the ASP applications or the soft-

ware for future referencing of the data generated.

Craig Smith
IT manager, West Chester, Pa.

In October 2003, I read in Screen shots, a blog site in Malaysia run by a guy named Jeff Ooi, an apology by the editor of the Hong Kong edition of Computerworld for having plagiarized another writer. The admission and apology came only after Ooi had exposed the plagiarism in his

blog. You have no idea how much I hated reading that.

I worked at Computerworld Hong Kong from 1990 to 2000 and served as the editor for more than eight of those years. During that time, a lot of very talented, dedicated people worked tirelessly to build that publication into what was unquestionably the premier IT newspaper in Asia. And in the blink of an eye, this idiot trashed everything we had done. I said as much in a blog entry I submitted to Ooi's site. I also commended him for exposing it and encouraged him to keep the heat on. As much as I hated what had happened, I became a big fan of blogs that day.

That's why I'm especially gratified by the launch last week of a new blog area on our Web site [Quick-Link a920]. I'll be joining other Computerworld editors and guest bloggers in an aggressive effort to expand our delivery of compelling content to you and your peers.

Here's hoping the blogging momentum will build. And that your company will help build it. **Q 54781**

Don Tennant

The Case for The Portfolio Business Case

ARE YOU FINDING it more difficult lately to construct a good business case? Infrastructure managers are probably screaming, "I need for years!" But now it's becoming more difficult for development teams, too.

Part of this was caused by the "big package" revolution of the last decade. Getting every department that uses an ERP package, for instance, to contribute its portion of the upgrade costs is a hassle for most IT managers, especially when they hear, "We didn't ask for this, so we're not paying for it."

Now, other factors are starting to appear. Service-oriented architectures are a brilliant idea for advancing enterprise flexibility and speed to market. But they are a nightmare when it comes to tracing a stream of benefits in a department and tying them to the costs of common code.

It's time to rethink the business case, because the application as we've known it is dying and being replaced by a mix of infrastructure and middle layers with a little application code on top. Rather than a monolith that can be justified — and upgraded — as a unit, we have many moving parts, all on their own upgrade cycles.

Better CIOs have seized upon portfolio management to help them deal with reinvestment questions. The best among them have moved even beyond that to looking at the portfolio and the business value it supports as a whole and then making investment decisions to manage the top line (by increasing value generated) and bottom line (by decreasing the cost to deliver that value).

Rather than have each project justify itself, savvy CIOs ensure that the complete portfolio — investment and re-

Jon A. Tennant is a former CEO and one-time senior vice president and director of executive research at Meta Group Inc. He is now an executive advisor in Vancouver, British Columbia. He can be contacted at jon@tennant.com.

investment — maintains a desired rate of return.

Coupled closely with this notion is the idea that qualitative business value — the gains you expect to be there but can't clearly quantify — comes from other gains valid a revenue impact, hence a top-line gain in value for the portfolio, regardless of the size. I like it, because it's the overall profile of the infrastructure supporting the business that matters, not whether one part of it is experiencing a temporary cost bubble due to upgrades.

If this sounds to you as though the CIO is running IT just as the business is run, you're right. Organizations must invest in themselves just to hold their market positions. They must develop new products and take the risk that the investment won't pay off. They must periodically replace worn plans, and equipment, refurbish customer points of presence, and match competitors' customer-service initiatives. This holistic view is precisely what modern IT systems demand.

Some of the problems the portfolio approach solves include:

- How do we justify changes we're making to support our enterprise architecture?
- What's the business value in reducing complexity, especially when it'll take years?
- How do we replace the old version of that core package when the clients don't want to pay for it?
- How do we justify infrastructure upgrades when there aren't enough new applications coming upstream to pay for them?

When you can say to a recalcitrant business peer, "We're doing this because it increases my ROI by 25%, and I'm not telling the CEO I'm leaving that money on the table," that's a CIO prize.

It's also a good way to demonstrate you're ready to run a business, not just IT. **EW 54072**

THORNTON A. MAY

Companies Striking Out On Strategy

THE PROCESS for making and executing strategy in most organizations is broken. Conversa-

tions with business school faculty colleagues conducting research on companies based in Canada, Mexico and the U.S. indicate that 70% to 90% of enterprises fail to successfully execute their strategies. The decision-making executives who track down matter and will set the course for the next decade. Using strategy-making and strategy execution processes appear to be fully understood to meet the challenge.

The IT Leadership Academy, drawing on research and executive interviews conducted at the CIO Executive Summit in New York and Southern California and at the CIO Round Table in Las Vegas, created a strategy diagnosis that pursued the world into four categories of organization:

1. Right strategy, right execution.
2. Right strategy, wrong execution (in part).
3. Wrong strategy, right execution.
4. Wrong strategy, wrong execution (in part).

This frightening data set motivated us to look closely at the conceptual model at work regarding making and executing strategies. The first thing we did was recheck the numbers. Could the practice of strategy truly be as bad as the numbers indicated?

THORNTON A. MAY is a longtime industry observer, management consultant and commentator. Contact him at thorntonmay@aol.com.

My occurs when people outside the organization can't figure out what your strategy is.

We asked executives in their 10th years of command whether the stated strategies of their organizations materially affected their day-to-day work place behaviors. More than 70% said they did not. While the top of the house might be in alignment regarding strategy, the people at the outer periphery are not. Perfect pictures of the future don't do anybody any good if they don't change behaviors. Strik- 3 for strategy occurs when the behavior of people inside the organization isn't driven by strategy.

Contentual wisdom to wonderful phrase first coined by John Kenneth Galbraith in *The Affluent Society* has it that strategy and strategies have bounced back from a near-death experience in the 1980s, a event during the whole dot-com boom-and-bust era, and the recent episode of

crisis management control. Strategies are coming back on the executive agenda. Unfortunately, some executives believe that strategy is a strategy-making and strategy-executing tool all over the map.

In this very readable, *Strategy Maps: A Systems Integrable Approach* (Jungblut, 2004), Robert S. Kaplan, former professor and David D. Norton, former leader, provide a very understandable definition of strategy. Strategy is based on differentiated customer value proposition. Strategy requires a clear articulation of targeted customer segments and the value proposition required to please them. Clarity of this value proposition is the single most important dimension of strategy. Strik- 1 for strategy comes when organizations don't keep this very simple definition in mind.

As a historian, I believe that all signs indicate that we have emerged into what tomorrow's business historians could term a strategy era, an era when firms have a big choice about their future evolution. Understanding and fixing broken strategy-making and strategy-executing processes will be a big part of determining whether the future is one you will enjoy. **EW 54733**

The End Is Not Near for Corporate IT

DISAGREE With Nicholas Carr in "The End of Corporate IT" (*QuickLink*, 5/31/05)? He states that smaller companies will find it difficult to buy their own systems, but in reality, prices are falling so that now even individuals can afford to buy computing power and storage.

Also, IT is not exactly a commodity like gas or electricity. The major cost of IT at the moment and in the foreseeable future is application development and implementation of company-specific business logic.

The cost of hardware and even software is a direct price compared to the. Obviously, certain business architectures become standard and it makes no sense for a company to develop them on its own. The company may use a third-party utility

company, for example, to store and secure large amounts of data. Still, it would be difficult to "utilize" company-specific logic and intellectual property.

Dimitri Nevedrov
Senior software engineer,
Superior, Colo.
dimitri_nevedrov@hotmail.com

I THINK CARR MISSES one important point: While electrical generation equipment moved to utilities, the machines used to produce the goods do not. Which parts of our IT infrastructures are a direct part of product delivery and which just supply cycles, memory and reports?

Bob Hays

COMPANYING COMPUTING TO

Current generation of Web computing, applications and storage. Having been a victim of ASP usage gone wrong, I can tell you that for most business-critical apps, there is no way a company can rely on Internet-based outsourced services. The delivery is slow and sometimes non-existent, and you still require most of the same infrastructure as if you provided the services for yourself (wasteful power generation). There are some niches, that these services can fill, but I wouldn't depend on them for running businesses or mission-critical applications ever again. It cost us lost productivity, and now we don't want the data produced by the ASP applications or the soft-

ware for future referencing of the data generated.

Craig Smith
IT manager, West Chester, Pa.

COMPUTERWORLD HONORS PROGRAM 2005

06.06.05

INNOVATION HAPPENS ALL THE TIME. So much so that we sometimes overlook the significance of recent technological advances. Ten years ago, we marveled at the possibilities of the Internet, instant messaging and camera phones. Now, those innovations have become commonplace.

While we accept such advancements without hesitation, we should nonetheless take time to honor those individuals and institutions that bring them to the world.

The Computerworld Honors Program aims to do just that. It recognizes the men, women, companies and institutions that drive the IT revolution and records their positive impact on society.

"It's a chance to honor the folks who are doing terrific things for the advancement of society. Some of their achievements are absolutely remarkable," says Computerworld President and CEO Bob Carrigan.

The Chairmen's Committee, made up of CEOs and chairmen from the world's leading IT companies, in April announced this year's 160 laureates. Selected from more than 300 nominations, they come from leading corporations, schools, nonprofit organizations and government agencies.

A panel of judges consisting of leaders in corporate, government, academic and other organizations next chose 50 finalists in 10 categories: business and related services; education and academia; environment, energy and agriculture; finance, insurance and real estate; government and nonprofit organizations; manufacturing; media, arts and entertainment; medicine; science; and transportation.

Continued on page 24

Witness to IT History

This permanent record of IT innovation serves as a tribute to the men and women who push technology's bounds. **By Mary K. Pratt**

Continued from page 23

Those finalists will attend tonight's awards gala in Washington, where the 10 winners from around the world, one in each category, will be announced.

"We really know we are going to represent best of class on a world basis," says Patrick McGovern, chairman and founder of IDC, Computerworld's parent company.

McGovern says he established the Honors Program in 1988 to counter the negative reports about technology that dominated the general media. "We felt how unfair it was for society to hear those stories when so many were doing innovative things," he says.

The Honors Program seeks to record that history by preserving case studies, oral histories, conference proceedings, publications, videotapes and other recordings related to the recognized innovations. These documents — available both online and through donations to affiliated universities, libraries and research institutions around the world — serve as rich resources for scholars and other interested individuals.

The program has grown significantly in the past 18 years, and the list of laureates is nothing short of extraordinary. Consider these diverse examples: The Egyptian Ministry of IT and Communications was named a laureate in 2004 in the government category for its work with a single, unified e-government portal that allows citizens and potential investors to directly access the services they need.

The Bayfront Medical Center in St. Petersburg, Fla., won a laureate in 1998 in the medicine category for its comprehensive Web site that acts as a community health care resource. And the Non-toxic and Bio-Integral Resource Center in Berkeley, Calif., was a laureate in 1992 in the science category for its unique databases detailing non-toxic and least-toxic alternatives to certain pesticides.

As for the negative reports about technology, McGovern sees them increasingly being supplanted by stories about how IT improves our lives in countless ways. "The incidents of the bad news stories have seemed to disappear," he says.

"Now you see a lot of coverage about applications that are beneficial to the company and the quality of life for people." © \$4400

Finalists

We profile a small selection of the finalists on these pages; the complete list of 47 finalists is on our Web site:

Environment, Energy & Agriculture: Shell Oil Products US

Designed for customers, an online portal delivers unexpected savings.

When Shell Oil Products US and associate company Motiva Enterprises LLC decided to condense three customer portals into one, the objective was to better serve customers.

But the new Shell Source portal also created savings and efficiencies beyond those initially envisioned, says Frank J. Trogus, CIO at the two Houston-based fuel companies. "When you put in a system in like this, there are a lot of unintended benefits," he says.

Shell Source has reduced IT support costs by 15% and saved \$5 million annually in printing and mailing costs. In addition, with only one portal to maintain, the IT group is able to do more preventive maintenance on the system. The company has also been able to push content to customers, including gas stations, wholesalers and dealers, through the Web site quicker.

Meanwhile, customers can manage their accounts in real time at a single site. "Success is based on how this is taken up by the customers, and it has been taken up very well," Trogus says.

Building great success took a collaborative spirit between IT and the business units, Trogus says. Still, challenges existed. IT had to link disparate systems, and business units and customers had to adopt standard business processes.

Trogus says Shell and Motiva made a big investment in systems, interfaces and upgrades; he wouldn't disclose the exact amount but says multiple millions of dollars were spent. The system went live in late 2003 and has already paid for itself, Trogus says.

And even though Shell Source is considered a benchmark portal, Trogus says the system was designed to be flexible so it could "morph into the next generation." © \$4500

Manufacturing: Premier Manufacturing Corp.

A paper process is ditched in favor of an automated data-collection system, saving \$150,000 annually.

David Scott, CIO at Premier Manufacturing Corp. in Cleveland, saw a chance to save \$150,000 annually by automating a data collection process that had been done manually.

But Scott's decision did significantly more than that: The shop-floor monitoring system, known as FactoryMRL, also increased manufacturing capacity by 7% and labor efficiencies by an estimated 15% while reducing annual setup costs by \$130,000 and defects by 50%.

"We're saving hundreds of thousands of dollars annually with this," Scott says. "It's paid for itself already." Premier Manufacturing, which fabricates wire products, employs about 500 people at three U.S. locations. Its production workers had tracked information on paper, writing down what

they did, the time it took, the volume produced and other information. Another dozen or so people handled these production cards — hundreds of them every day — using them to analyze production information and calculate workers' incentive-based pay.

"As any CIO is supposed to do, I looked at it and saw that it was wasteful," Scott says, adding that he initially calculated that the company spent \$3,000 a week just to handle those cards. So in 1999, Scott decided to automate the process. When he didn't find any off-the-shelf technology products, he teamed up with Progress Software Corp. in Bedford, Mass., to develop, deploy, integrate and manage an application. Premier Manufacturing spent about \$800,000 on the project, which was implemented within nine months, Scott says.

The company continues to add features and see benefits. In addition to collecting production data of all sorts, the system can even help detect when production workers are fatigued, Scott says, based on their performance rates.

"We keep finding new analyses, reports and tools we can do with this," Scott says. "So for the past four or five years, it's been a continuous improvement path we've been on." © \$4802

Education & Academia: University of North Carolina, School of Information and Library Science

An eclectic mix of digital content, managed by its contributors, helps advance information sharing.

Ibiblio has been a leader in cyberspace for some time. Started as Sunsunc.edu in 1992 and housed at the University of North Carolina at Chapel Hill, Ibiblio is a contributor-run digital library whose eclectic collection of material remains a standout on the Internet.

Ibiblio's diverse mix is more than a curiosity, though. It advances the sharing of information.

"Our goal is to facilitate the distribution of knowledge to the people of North Carolina and, as far as possible, the people of the world," says Paul Jones, Ibiblio's director and a clinical associate professor at UNC's School of Information and Library Science.

Today, Ibiblio has more than 1,500 collections of shareable information, distributes over a terabyte of open-source and free software, and handles more than 12 million requests daily from people downloading software, listening to music and reading Web pages.

Ibiblio also plays a significant role in research and innovation. For example, it pioneered Internet radio in 1994 by putting online a digitized simulcast of WXYC, UNC's student radio station.

These advances have come with challenges. For example, Jones has to handle claims of copyright violations, and while true violations have been few, he says, dealing with false claims is time-consuming.

None of this, however, is hindering Ibiblio's present or future. Jones says Ibiblio will continue to evolve as demands for information change. And how it looks in 10 years will undoubtedly be different, he says, because technology will change. But, he adds, the principles that have shaped Ibiblio so far — a dedication to freely sharing information at a site managed by contributors — will remain. **■ 54565**

Education & Academia: University of Michigan, College of Pharmacy

A Web-based teaching tool gives medical chemistry students more interactive study materials.

Mustapha Beleh saw limits in standard teaching tools like blackboards, overhead projections and PowerPoint presentations. They give only two-dimensional glimpses to concepts that deserve 3-D explanations.

So Beleh developed the Medicinal Chemistry Virtual Library, a Web-based teaching tool designed to give more-detailed information to students at the University of Michigan's College of Pharmacy.

The site has lecture notes with an interactive component that allows students to move with just a click from a concept mentioned in one course to the in-depth explanation that happened in another.

Other features include tutorials giv-

ing in Flash format and online practice quizzes that determine the question sequence based on student answers. It also has libraries that detail the chemical structures of all clinically available drugs along with their generic and trade names, and links to sound bites to correct pronunciations.

Beleh is adding virtual labs to the site so students can see what happens inside an experiment — something they can't always see in a real lab.

Beleh, who is a lecturer at the university and a pharmacist, started to work on the Medicinal Chemistry Virtual Library when he first arrived at the University of Michigan in 1999. He did much of the technical work himself. And while Beleh relied on university-developed tools, he says he frequently asked developers to modify the tools so they'd do what he wanted.

Beleh plans to add material from classes beyond the four-course medicinal chemistry sequence. He also wants to develop modular applications so faculty members who aren't technically skilled can easily work with an interface to get their information online.

And he wants to expand the concept beyond the University of Michigan. "I haven't seen anything close to this," he says, "so I think it would be a very useful tool to others." **■ 54563**

Science: International AIDS Vaccine Initiative Inc.

Critical AIDS vaccine information is transmitted from multiple remote sites to centralized databases.

The Pan-African Resource Network connects 300 scientists, researchers and other clinicians at about a dozen sites in five African countries. Its goal is to increase the speed and efficiency of data sharing, which is essential in the search for an AIDS vaccine.

"It definitely accelerates the search for an AIDS vaccine," says Ronaldo Lima, senior director of IT at International Aids Vaccine Initiative Inc. (IAVI), a New York-based nonprofit organization.

IAVI operates as a hub for AIDS vaccine research and development. As part of its mission, the 9-year-old organization is implementing a reliable IT infrastructure to transmit clinical and laboratory data from multiple remote sites to centralized databases.

Lima says establishing this connectivity in sub-Saharan Africa presents challenges that don't exist in developed countries. Existing computer networks aren't always reliable, the electricity supply can be undependable, and government regulations often slow the implementation of new technologies.

The Pan-African Resource Network, which dates back to 2002, has to contend with those issues and do so in a cost-effective way, Lima adds.

The solution involves the use of hybrid network systems that increase the reliability and cost-efficiency of long-distance data transmissions. IAVI workers consider the bandwidth, technology and service reliability in each region when deciding on systems. They opted for a radio link Internet connection in Rwanda, but they used a satellite connection in Uganda.

While Lima says this network can speed the development of an AIDS vaccine, he sees benefits well beyond that. "Even after we have an AIDS vaccine, all this capacity-building will help people have more access to information and knowledge." **■ 54564**

Innovations by InterSystems

Multidimensional Database Combines Robust Objects And Robust SQL

Imagine being able to rapidly develop applications that run much faster, with massive scalability. Now you can, with our multidimensional database for transaction processing and real-time analytics.

Only Caché combines robust objects and robust SQL, thus eliminating object-relational mapping. It requires little administration, delivers speed and scalability on minimal hardware, and comes with a rapid application development environment.

These innovations mean faster time-to-market, lower cost of operations, and higher application performance. We back these claims with this money-back guarantee: *Buy Caché for new application development, and for up to one year you can return your license for a full refund if you are unhappy for any reason.**

Innovative database. Guaranteed performance.

InterSystems
CACHÉ

Rapid Integration Platform Makes Applications Perform In Concert.

Imagine being able to get your applications to perform together as an ensemble. Easily.

Now you can, with our universal integration platform.

Ensemble is the first fusion of an integration server, data server, application server, and portal development software – in a single, seamless product. This is the complete ensemble of technologies needed for rapid integration, fast development, and easy management.

These innovations mean all of your integration projects will be completed on time and on budget, with a simplified learning curve for your IT staff. We back these claims with this money-back guarantee: *For up to one year after you purchase Ensemble, if you are unhappy for any reason, we'll refund 100% of your license fee.**

Innovative integration. Guaranteed performance.

Whirlpool CEO says the company's supply chain projects have earned it a competitive advantage.

Five years ago, Whirlpool began an effort to turn around its global supply chain. The company is seeing results, but it's not done yet.

By Gary H. Anthes

THE SUPPLY CHAIN at Whirlpool Corp. in 2000 was broken. Indeed, a manager there at the time quipped that among the four major appliance makers in the U.S., Whirlpool ranked fifth in delivery performance.

"We had too much inventory, too little inventory, wrong inventory, right inventory/wrong place, any combination of those things," says J.B. Hoyt, who was then supply chain project director. He says a sales vice president approached him one day and said he'd accept even worse performance from supply systems if they would just be consistent rather than wildly bouncing back and forth between good and poor production and shipping plans.

So in 2001, Benton Harbor, Mich.-based Whirlpool embarked on a multiproject global overhaul of its supply chain systems. The metaproject remains a work in progress today, with a number of systems yet to be rolled out and some major technical issues to be resolved. But managers at

Whirlpool say its success to date — including huge improvements in customer service and reduced supply chain costs — is providing the psychological and financial impetus to drive the remaining systems work.

Whirlpool CEO East Seiser says that by 2000, the company had grown by acquisition and geographic expansion to the point that old systems, stitched together by spreadsheets and manual procedures, couldn't cope with the exploding complexity. "Our supply chain was becoming a competitive disadvantage for us," he says. Availability — the percentage of time a product is in the right place at the right time — was an unacceptably low 83%, even as inventories remained too high overall.

The homegrown supply systems were primitive and not well integrated with the company's SAP ERP system, which had been installed in 1999, or with a legacy production scheduling system, Seiser says. And they weren't integrated with the systems

FIELD REPORT

of major wholesale customers or suppliers of parts and materials. "The plans we were creating weren't linking back into reality," he says.

In particular, Seiser says, supply chain systems weren't fine-grained enough, nor were they very good at juggling priorities and constraints except through slow and cumbersome manual methods. Often, they would optimize locally — a single product line at one location, for example — but not for the supply chain as a whole.

Here's what Whirlpool was using for its North American supply chain in 2000:

- A homegrown production scheduling system, the Whirlpool Manufacturing Control System (WMCS), which was developed in the mid-1980s and extensively modified over the years.

- SAP AG's R/3 ERP system, which was installed in 1999 and used for transaction-processing applications such as accounting and order processing.

- i2 Technologies Inc.'s Demand Planner (now called Demand Manager), which was installed in 1997 and used for demand forecasting.

- A system for distribution planning that was custom-developed for Whirlpool in the 1980s that used optimization software from ELOG Inc.

Then, in 2001, Whirlpool began to implement an advanced planning and

SUPPLY CHAIN

Whirl

TRANSFORMATION TIMELINE

Integrate supply chain transaction-processing applications using SAP's R/3 ERP systems.

Begin companywide standardization, with SAP and IBM as strategic partners. Goals: Cost savings and simplification of systems.

Integrate and improve supply chain planning and optimization with 12 products in North America. Customer service levels soar and costs fall.

Integrate with systems of major trade partners Sears, Best Buy and Lowe's using an i2 Web collaboration tool. Demand forecasts improve dramatically.

Integrate and improve supply chain planning and optimization with SAP products in Europe. Goals: Improve product availability and reduce costs.

Still to Be Done

- SAP integration with major suppliers using SAP's eSourcing
- Major market integration with SAP Web tools
- SAP customer portal integration with SAP
- European system integration
- SAP integration in North America

CONSIDER THE POSSIBILITIES

Whirlpool's North American Supply Chain Is Complex

3,000-plus distinct products

11 domestic manufacturing facilities

11 factory and 10 regional distribution centers

Thousands of retail and contract customers

75,000 appliances shipped per day

including SAP's costs. It included a suite of supply chain integration and optimization tools from i2. Supply Chain Planner for Master Scheduling, Deployment Planning and Inventory Planning. Those three modules lie at the heart of Whirlpool's efforts to fix its supply chain, went live in three phases over 2004 and 2005.

In mid-2003, Whirlpool installed the i2 TradeMaster collaborative Planning, Forecasting and Replenishment (CPFR) system, a Web-based collaboration tool for sharing and combining the sales forecasts of Whirlpool and its major trade partners—Sears, Roebuck and Co., Lowe's and Best Buy Co. The system is a component for Web-based collaboration with suppliers, based on SAP's Inventory Collaboration Hub. It is just getting under way. And Whirlpool continues to use the old WMI's for production scheduling but plans to replace that with SAP's Production Planning module.

It's Available

By all accounts, the supply chain overhaul has been a smashing success for the \$13 billion company. CPFR cut forecasting errors in half. APS boosted availability in North America from 85% to 93% (it's at 95% today), reduced finished-goods inventories by more than 20% and trimmed 5% from freight and warehouse costs. Whirlpool declined to discuss the cost of the projects.

Managers at Whirlpool gave much of the credit for the success of these projects to a close partnership between the IT department and the business units. Says Hoyt, "It was one of the first times the IT community didn't say, 'OK, here's your tool.' We said the tool had to do it, y or n. 2. We did the requirements analysis together."

Whirlpool considered standardizing completely on SAP for all ERP and supply chain systems in North America, but i2 ultimately got the nod for the APS system, the critical part needed to fix the company's availability and inventory problems. "There was a lot of back and forth, but after a long litany and discussion of our business requirements, we settled on the i2 tool set in North America," Hoyt says.

But while i2 was seen as being more capable than SAP for handling the fine grained optimization, constraint-based planning and prioritization that the business units wanted, it was far from ideal from an IT perspective. The APS system would cost \$11, whose budget is about \$90 million, more than an all-SAP supply chain because there would be less integration, more systems inter-

Think Globally, Act Locally

WHEN THE TIME CAME for Whirlpool Europe to overhaul its supply chain, the company decided not to go with i2 optimization products, as North America had done, but with SAP's Advanced Planner and Optimizer (APO) for demand and supply network planning.

Vivek Mehta, a lead supply chain analyst involved in both projects, says Europe was starting from a more primitive systems base, with even more manual procedures and less integrated systems than had been the case in North America. So for Europe, "APO was a huge step forward," he says.

The integration of Whirlpool Europe's supply chain systems around APO, though not quite complete, has already boosted inventory availability from less than 80% to more than 90%. Says Walter Martens, supply chain director in Whirlpool's Commo, Italy, operations center:

"Today, our supply chain is integrated—processes and systems," he says. "Now, demand from a trade partner or customer is integrated into production planning. We can look into production

plans and see if this item for this date in this quantity is for this customer. So we can now act pretty depending on the type of demand."

For example, he says, priority is always given to production orders earmarked for specific customers, for which availability is now 97%—over orders to simply replenish stock.

Still, improvements need to be made, especially at the level of individual factories, Martens says. Some factory managers, in an attempt to tweak system rules and parameters to optimize their operations, make the systems so complex that they become maintenance nightmares. And, he adds, attempts by factories to optimize their own performance can be at odds with optimizing the European supply chain as a whole.

Finally, Martens says, while production can be wended daily by altering system rules and parameters, some production modifications require workbench changes or changes in line and equipment capacities, which can take weeks to accomplish. "That's very difficult," he notes.

—Gary H. Antles

faces and more skills to maintain infrastructure. Plus, IT was worried about i2's deteriorating financial condition.

Whirlpool had already standardized on IBM AIX application servers and iSeries mainframe database servers for supply chain systems and had put systems for all its global operations in a single data center in Boston Harbor. Now, it was time to standardize on software.

So in 2001, a mandate came from the CEO, i2's Whirlpool's Executive Committee, that supply chain modernizations henceforth would be based entirely on SAP. In particular, new systems planned for Europe for 2002 and Latin America would use SAP's Advanced Planner and Optimizer rather than the more capable but costly i2-based APS system used in North America. And they were to use SAP's NetWeaver for Web collaboration with suppliers and trade partners rather than North America's TradeMaster CPFR.

Vivek Mehta, a lead supply chain analyst at Whirlpool, says SAP may catch up with i2 in its optimization capabilities, but in the meantime, i2's financial condition is worrisome. "There were 10 guys at i2 that we interacted with, and some of them are gone now," he says. "There's lack of continuity."

"We have this challenge, where the IT organization is pushing for everything to be SAP, but the business, on the other hand, is going for whatever brings them value," Mehta says. "They are now used to the optimal plan, the high service levels, the lower inventories. So if we bring in something and say their availability will go down by a couple of points, no way will they buy that."

Sears says Whirlpool will probably replace i2 with SAP "eventually," but is in a hurry. "We'd like to get the return out of that investment before making any platform decisions," he says.

Sears says that in the four years since Whirlpool standardized on IBM and SAP as "strategic partners," revenue has increased on average \$1 billion per year and IT expenses have fallen 6% per year. He says there are several joint development projects under way involving all three companies.

But for the time being, the combination of SAP and i2 works well for Whirlpool, far better than the legacy tools of a few years ago. Sears says the company's supply chain is now a competitive advantage. "On a global scale, to be able to manage all your operating platforms, I'm not aware that any of our competitors have that today," he says.

Supply Chain Data

CONSIDER THE POSSIBILITIES

scheduling (APS) system. It included a suite of supply chain integration and optimization tools from i2 — Supply Chain Planner for Master Scheduling, Deployment Planning and Inventory Planning. Those three modules, the heart of Whirlpool's efforts to fix its supply chain, went live in three phases over 2001 and 2002.

In mid-2002, Whirlpool installed the i2 TradeMatrix Collaborative Planning, Forecasting and Replenishment (CPFR) system, a Web-based collaboration tool for sharing and combining the sales forecasts of Whirlpool and its major trade partners — Sears, Roebuck and Co., Lowe's Cos. and Best Buy Co.

The rollout of a component for Web-based collaboration with suppliers, based on SAP's Inventory Collaboration Hub, is just getting under way. And Whirlpool continues to use the old WMCS for production scheduling but plans to replace that with SAP's Production Planning module.

It's Available

By all accounts, the supply chain overhaul was a smashing success for the \$13 billion company. CPFR cut forecasting errors in half. APS boosted availability in North America from 83% to 93% (it's at 97% today), reduced finished-goods inventories by more than 20% and trimmed 5% from freight and warehouse costs. Whirlpool declined to discuss the cost of the projects.

Managers at Whirlpool give much of the credit for the success of these projects to a close partnership between the IT department and the business units. Says Hoyt, "It was one of the first times the IT community didn't say, 'OK, here's your tool.' We said the tool had to do x, y and z. We did the requirements analysis together."

Whirlpool considered standardizing completely on SAP for all ERP and supply chain systems in North America, but i2 ultimately got the nod for the APS system, the critical part needed to fix the company's availability and inventory problems. "There was a lot of back and forth, but after a long harangue and discussion of our business requirements, we settled on the i2 tool set in North America," Hoyt says.

But while i2 was seen as being more capable than SAP for handling the fine-grained optimization, constraint-based planning and prioritization that the business units wanted, it was far from ideal from an IT perspective. The APS system would cost IT, whose budget is about \$190 million, more than an all-SAP supply chain because there would be less integration, more systems inter-

WHEN THE TIME CAME for Whirlpool Europe to overhaul its supply chain, the company decided not to go with i2 optimization products, as North America had done, but with SAP's Advanced Planner and Optimizer (APO) for demand and supply-network planning.

Vivek Mehta, a lead supply chain analyst involved in both projects, says Europe was starting from a more primitive system base, with even more manual procedures and less-integrated systems than had been the case in North America. So for Europe, "APO was a huge step forward," he says.

The integration of Whirlpool Europe's supply chain systems around APO, though not quite complete, has already boosted inventory availability from less than 80% to more than 90%, says Walter Manfredi, supply chain director in Whirlpool's Comerio, Italy, operations center.

"Today, our supply chain is integrated — processes and systems," he says.

"Now, demand from a trade partner or customer is integrated into production planning. We can look into production

plans and see if this item for this date in this quantity is for this customer. So we can now give priority depending on the type of demand."

For example, he says, priority is always given to production orders earmarked for specific customers — for which availability is now 87% — over orders to simply replenish stock.

Still, improvements need to be made, especially at the level of individual factories, Manfredi says. Some factory managers, in an attempt to tweak system rules and parameters to optimize their operations, make the systems so complex that they become maintenance nightmares. And, he adds, attempts by factories to optimize their own performance can be at odds with optimizing the European supply chain overall.

Finally, Manfredi says, while production can be varied daily by altering system rules and parameters, some production modifications require workforce changes or changes in line and equipment capacities, which can take weeks to accomplish. "That's very difficult," he notes.

faces and more skills to maintain inventory. Plus, IT was worried about i2's deteriorating financial condition.

Whirlpool had already standardized on IBM AIX application servers and zSeries mainframe database servers for supply chain systems and had put systems for all its global operations in a single data center in Benton Harbor. Now it was time to standardize on software.

So in 2001, a mandate came from the CIO, via Whirlpool's Executive Committee, that supply chain modernizations henceforth would be based entirely on SAP. In particular, new systems planned for Europe for 2003 and Latin America would use SAP's Advanced Planner and Optimizer rather than the more capable but costly i2-based APS system used in North America. And they were to use SAP's NetWeaver for Web collaboration with suppliers and trade partners rather than North America's TradeMatrix CPFR.

Vivek Mehta, a lead supply chain analyst at Whirlpool, says SAP may catch up with i2 in its optimization capabilities, but in the meantime, i2's financial condition is worrisome. "There were 10 guys at i2 that we interacted with, and some of them are gone now," he says. "There's lack of continuity."

"We have this challenge, where the IT organization is pushing for everything to be SAP, but the business, on the other hand, is going for whatever brings them value," Mehta says. "They are now used to the optimal plug. The high service levels, the lower inventories. So if we bring in something and say their availability will go down by a couple of points, no way will they buy that."

Sears says Whirlpool will probably replace i2 with SAP "eventually" but is in no hurry. "We'd like to get the return out of that investment before making any platform decisions," he says.

Sears says that in the four years since Whirlpool standardized on IBM and SAP as "strategic partners," revenue has increased on average \$1 billion per year and IT expenses have fallen 6% per year. He says there are several joint development projects under way involving all three companies.

But for the time being, the combination of SAP and i2 works well for Whirlpool, far better than the legacy tools of a few years ago. Sears says the company's supply chain is now a competitive advantage. "On a global scale, to be able to manage all your operating platforms, I'm not aware that any of our competitors have that today," he says.

MENTION Sun Microsystems Inc. to someone, and it's likely to evoke images of high-powered workstations, dot-com servers and Java. But a peek inside Sun Microsystems Laboratories reveals a much broader array of emerging technologies and hints at a new Sun rising.

Sun Labs in Menlo Park, Calif., employs some 200 scientists and engineers and spends \$80 million to \$100 million a year. Its projects include sensors, supercomputers, high-speed networking, optical interconnects, third-generation Web technologies, Java and more. Its mission: "To solve hard technical problems brought to us by our customers," says Glenn T. Edens, director of Sun Labs.

Making the Switch

For example, Internet switches capable of handling tens to hundreds of terabits of traffic per second today cost millions of dollars and fill entire rooms. But if an ongoing project at Sun Labs is successful, such switches will have dimensions and price tags more like those of PCs. "It's a high-risk, high-return project. We think it will work, but we don't actually know," Edens says.

Ultrachip, high-capacity switches are just one potential application of a technology

called proximity communication that Sun announced last fall. Proximity I/O, as it's also known, can enable processor chips to communicate 40 times faster and with 30 times less energy than is possible using conventional means.

"Proximity allows us to very nicely spread a switch out over a number of chips and have enough bandwidth between them so we can have a distributed switch," says Robert Drost, a research scientist at Sun Labs. "Proximity" refers to the positioning of two chips extremely close to each other, each with transmitter and receiver circuits.

Data is sent across the gap by "capacitive coupling," which is coupled between charging particles that are at rest. It's simple in principle, but it's devilishly difficult to align the chips to tolerances of a few microns.

In proximity I/O, the long communication paths on printed circuit boards with soldered connections and wires are replaced by the tiny, simple interchip gaps. "When processors went from 10 MHz to 3 GHz, they didn't become 30 times faster, because the bandwidth didn't increase by 30 times; it increased by two times," Drost says. "Proximity I/O will finally realize the potential performance on the chip."

In addition, he says, very

fast interchip communications could reduce the need to have big on-chip caches, freeing up scarce chip real estate for other kinds of processing functions.

Supercomputers

Last July, Sun won a three-year, \$50 million contract from the Defense Advanced Research Projects Agency to design a supercomputer with ultrahigh internal bandwidth based on proximity I/O. IBM and Cray Inc. each won awards for designs based on different principles.

Drost says the supercomputer will be "massively parallel," with hundreds of thousands of threads executing in parallel. It will excel at problems that require a lot of interprocessor communications, such as database searches, scientific simulations and signal processing. If Sun wins approval to build a working machine in the next

phase, one or more prototypes could be installed by 2003, Drost says. Those machines would run at sustained speeds of 1 quadrillion floating-point operations per second (PFLOPS), about 15 times faster than the fastest supercomputer today, and be scalable to 4,096 PLOPS.

Sun Labs is working on computers at the other end of the spectrum as well, and it claims to have developed the world's smallest energy-aware Web server. Code-named Sizzle, the server is the size of a quarter and is intended to go inside home appliances, personal medical devices, sensors and the like. It's a battery-powered, wireless device with an eight-bit processor, 128KB of flash memory and 4KB of RAM.

Others have built tiny Web servers, but what distinguishes Sizzle is its use of elliptic-curve cryptography (ECC), which is more efficient than RSA cryptography and hence more suitable for compute-challenged processors.

Users of the industry-standard RSA have moved to 1,024-bit encryption keys and will eventually have to move to 2,048 bits to ensure that the keys aren't broken. Every doubling of key length requires an increase of computer power by a factor of eight.

But ECC at comparable strengths is 10 times faster than 1,024-bit RSA keys and 38 times faster than 2,048-bit RSA keys, says Vipul Gupta, a

senior engineer at Sun Labs.

"The next generation of Internet devices, such as sensors, are expected to be even less capable than phones, and these devices just don't have the horsepower for RSA," he says.

Gupta has worked with the Internet Engineering Task Force to get ECC integrated into the Secure Sockets Layer encryption protocol, just as RSA has been integrated with it. Now, he says, developers can write software that interoperates with Sizzle as easily as with any other secure server. Applications include battlefield sensors, personal medical devices and radio frequency identification tags for confidential situations.

Gupta says ECC may find applications in large servers as well. A big e-commerce company such as Amazon.com Inc. could get by with a quarter to half as many servers if it used ECC rather than RSA, he says.

Security isn't the only thing Sun Labs is trying to get to work on tiny computers. Its Project Epsilon is based on the belief that real applications of sensor networks are scarce because sensors communicate unilaterally and are hard to configure and program.

"We are working on how to program these things," Edens says. "And we're relying on radio protocols, because IP was developed with no thoughts to power savings, and we are working on how to upgrade software if you have 10,000 of these."

The answer to some of these questions is Java, Sun says. Java will bring interoperability and ease of code migration, says Randy Smith, a principal investigator at Sun. But it's not easy, he acknowledges. The key is getting Java to run on bare metal — no operating system. "It's a shoe-horning thing," Smith says. ☐ 54173

PAY MORE ATTENTION TO SERVERS BEFORE YOU BUY THEM. SO YOU CAN PAY LESS ATTENTION

IBM eServer® xSeries®

Affordable, reliable, easy to manage: eServer® xSeries® with Intel® Xeon™ Processors

IBM eServer xSeries 236 Express

Designed to improve performance and availability, with a range of features such as redundant hot-swap power and cooling

System features

Up to two Intel Xeon Processors 3.60GHz
Two-way tower with rack capability
Up to 9 hot-swappable SCSI hard disk drives
IBM Director
Limited warranty up to 3 years on-site*

From **\$2,989***

IBM Financing Advantage
Only **\$82** per month†

IBM eServer xSeries 346 Express

Help maximize performance and improve availability in a rack dense environment with Extended Design Architecture. Includes features like Calibrated Vented Cooling, an IBM innovation that helps to keep your system cool and improve uptime

System features

Up to two Intel Xeon Processors 3.60GHz
Two-way 2U rack server
Up to 16GB DDR2 memory using 8 DIMM slots
Calibrated Vented Cooling IBM Director
Limited warranty up to 3 years on-site*

From **\$3,999***

IBM Financing Advantage
Only **\$199** per month

IBM eServer xSeries 366 Express

With the power of 3rd generation Enterprise X-Architecture, it sets a new standard for 4-socket, 64-bit servers. Delivers increased performance, systems manageability, and simultaneous support for 32 and 64-bit apps.

System features

Up to four 64-bit Intel Xeon Processors MP 3.66GHz
64GB DDR memory
2GB memory expandable to 64GB
Six 64-bit Active PCI-X 2.0
IBM Director
Calibrated Vented Cooling
Limited warranty up to 3 years on-site*

From **\$13,779***

IBM Financing Advantage
Only **\$379** per month†

IBM eServer BladeCenter™

Flexible and easy to use

IBM eServer BladeCenter H220 Express

Designed to support the Intel Xeon Processor and packed with high-availability features, the eServer BladeCenter H220 with industry-leading modular design delivers density without sacrificing processor performance.

System features

Up to two Intel Xeon Processors 3.60GHz
Up to 14 blades per chassis
Supports both 32 and 64-bit applications
IBM Director
Limited warranty up to 3 years on-site*

From **\$2,586***

IBM Financing Advantage
Only **\$71** per month†

IBM TotalStorage® Simplify storage management to improve productivity

IBM TotalStorage DS300 Express

Entry-level, cost-effective SCSI storage systems designed to deliver advanced functionality at a breakthrough price. Provides an exceptional solution for work group storage applications, such as e-mail, file, print, database and Intel Xeon Processor-based servers.

System features

3U rack-mount entry level
Support for up to 14
Ultra320 SCSI disk drives
Starts at 564GB / Scales to 4.2TB
From **\$5,355***

Simultaneous support of heterogeneous operating system environments for xSeries and BladeCenter

Limited warranty 1 year on-site*

IBM Financing Advantage
Only **\$147** per month†

*All prices stated are IBM's estimated retail selling prices as of May 3, 2005. Prices may vary according to configuration. Resellers set their own prices. No reseller prices to end users may vary. TO THEM AFTER.

With IBM® Express Servers and Storage™ designed for mid-sized businesses, help is here.

You've already got a zillion things that require your attention – you shouldn't have to worry about your systems. That's why IBM Express products offer enhanced reliability, which helps them do their job so you can focus on yours.

Take IBM Director, for example.¹ It proactively notifies you of a potential problem – up to 48 hours in advance. Or our Calibrated Vectored Cooling feature available on select xSeries systems. It cools your system more efficiently. This means more features can be packed into a smaller server. Giving you more functionality and greater flexibility.

It's just an example of our self-managing features that help you take back control of your IT. Which can help lower your maintenance costs, too. Because with IBM Express Servers and Storage, innovation comes standard. It's not optional. Plain and simple, it's built in.²

There's also one more great feature – your IBM Business Partner. Which means you can have a one-to-one chat with someone who understands your industry and your business – and who's located in your neck of the woods. And for mid-sized businesses, that's really big help in a really big way.

THE WORLD'S HELP DESK

Learn more about our full range of IBM Express products. And find the IBM Business Partner near you – who is IBM trained to know which systems meet your specific requirements.

A DIY Project for Network Security

With sparse resources, our security manager has to do things herself. But a call has her feeling like part of the team. By C.J. Kelly

THE PAST FEW weeks have been frustrating and rewarding all at the same time. I had set a goal to configure an intrusion-detection system (IDS) using the de facto standard, Snort on Linux. In our environment, we have very little in the way of security tools and devices, and little or no budget to procure such items. This project was the first step in being able to detect potentially malicious network traffic as inexpensively as possible.

Having never done this personally because I previously managed engineers who knew how, and currently having no security-savvy staff to rely on, I was both tentative and excited.

I did several things to prepare. I found a white paper explaining the steps in detail. I figured that, if nothing else, I could follow directions. I also purchased and read a book, *The Tao of Network Security Management: Beyond Intrusion Detection*, by Richard Bejtlich (Addison Wesley Professional, 2004).

I also met with a friend and colleague, a CISSP and information security officer at a small company, who I knew had been running a similar system for many years. I tried to work my way through the Snort manual but then quickly put it aside as a reference for when I had the system configured and running.

Dumb Frustrations

The system is now in production and is producing volumes of data. The challenge is to an-

alyze this data and make sense of it.

There were so many small frustrations along the way that, at this point, I feel only relief that it appears to be working. I had what I call "dumb" frustrations.

For instance, I had a hard time downloading the enormous Red Hat Fedora Core 3 image files and burning those files to CD in the proper format. After numerous attempts and a dozen CDs that wouldn't boot, my colleague created a set of CDs for me to use.

Once the Linux operating system was installed, I realized that I couldn't remember Linux bash commands, so I printed a cheat sheet. Fortunately, the vi text editor commands came back to memory quickly. I followed the directions for installing the additional software needed for the system, step by step by step, then rebooted.

The system appeared to hang at a particular point, so I searched the Linux-newbie newsgroups for a solution. I never did find the exact solution, so I decided that I had

done something wrong and rebooted using the rescue CD.

Things went downhill from there, as I manually edited various configuration files based on the advice found online. My efforts ended in disaster, and I had to reinstall the entire system. Fortunately, it went a lot quicker the second time around, and I was able to pinpoint small mistakes I had made along the way the first time and correct them.

At long last, I could view the IDS alerts via HTTP and use Secure Shell to get into the system remotely. At the last minute, I realized that I had only one network interface card (NIC) in the system. D'oh! You have to have two.

One NIC runs in promiscuous mode and doesn't have an IP address. Its job is to receive traffic from the switch span port it's attached to. The additional NIC is necessary for remote administration of the system and is connected to a switch management port. I scrambled around for a NIC, shut the system down, installed the card and brought the system up again. Everything worked.

Managers With Depth

I thought a lot about the role of the information security manager while I was working on the IDS. I've noticed that in some companies, the security manager isn't expected to have technical depth, only astute management skills.

I have always believed that technical managers need to have enough depth to be able to back up the staff when a key employee has been lost or the situation demands an extra pair of hands and eyes.

That's a very tall order when you think about the array of security devices: virtual private network concentra-

tors, firewalls, routers and switches, access control and authentication mechanisms, intrusion detection and prevention, antivirus, antispy and so on. In an ideal world, there would be sufficient staffers with varied skills who could cross-train one another.

I am in a situation where there is no security expertise and very little network expertise. It's good news, bad news for me.

On the one hand, I have days of frustration, knowing that the buck stops with me.

On the other hand, I have days of pure fun while I hunt for solutions to network performance and security issues and implement them.

This past week was particularly good because I received a phone call from the information security officer of the department that my agency is a part of. I think his position is about three levels down from the governor's office, give or take a level. The officer wanted to garner my assistance for disaster recovery plans. He also realized that as a CISSP, I might be able to collaborate with one of his employees, who is also a CISSP.

Together, he proposed, we could create a security incident response team structure and find solutions to security problems within the state network, such as acceptable-use violations (i.e., surfing and downloading pornography).

Was this the first time I had heard that anyone in any state agency was actually looking to be proactive in regard to securing individual agency networks? I was excited to learn that years ago, they had gone down the same path that I'm on now and that they were happy to share their experiences. I felt, at that moment, that maybe I do fit in here. ☐

WHAT DO YOU THINK?

This week's journal is written by a real security manager, "C.J. Kelly," whose name and employer have been disguised for obvious reasons. Contact her at cmcclellan@cybersec.com, or join the discussion in our forum: forum.cw.com

BRIEFS

Meridian Launches
Proliance for ILM

Meridian Systems in Folsom, Calif., announced Proliance 3.0. The Web-based information lifecycle management software is designed to integrate facility and project management functionality and is built on a service-oriented architecture. XML technology supports a workflow engine in the software that drives business process management across all Proliance applications, according to Meridian. The product also includes a business intelligence layer with key performance indicators, dashboards and roll-up reporting. Pricing ranges from \$1,500 to 2,500 per seat.

Oracle Announces
Financial Hub Tool

Oracle Corp. last week released its Financial Consolidation Hub. The product, which will be included in Oracle's Corporate Performance Management suite of analytic applications, is designed to automate the financial consolidation cycle, from data submission to the dissemination of consolidated results, according to the company. The tool, which is available now, is built on a unified enterprise data model that's used in all of Oracle's CRM applications. Pricing is \$60 per license with a minimum of 2,500 licenses.

AppPiver Unveils
E-mail Service

e-Mail security vendor AppPiver LLC in Bell Branch, Pa., has announced a new SecureTide e-mail management service that incorporates antispyware, antivirus and content management tools. The product's content management tools allow monitoring and enforcement of e-mail usage policies without additional hardware or software, according to the company. SecureTide is priced at about \$675 per year for 50 users but will be available to existing AppPiver customers at an additional cost.

MARK WILLOUGHBY

The Operating System
As Cult Classic

NEGLECTED COMMUNITIES, be they small towns or virtual ecosystems, shrink and die in much the same way. Names and faces disappear, and real estate becomes empty.

In the physical world, over time, windows break, shingles tear off and loose items bang in the wind. Signs of atrophy appear more quickly in the virtual world. Web site links return the dreaded "Page cannot be found" screen, and the information that can be found is out of date and has clearly been neglected.

OS/2 user groups in the U.S. know neglect. They are diehards championing a doomed technology and maintaining their loyalty even as the operating system recedes from the IT landscape.

Most of the remaining physical user groups, as opposed to virtual organizations, are in Europe, where OS/2 still has a large presence, according to Mark Dodel, founding editor of the "VOICE Newsletter" (www.os2voice.org) for the OS/2 community.

A new cadre of younger OS/2 users in Europe, particularly in Germany, has started a small OS/2 renaissance as an alternative to Microsoft, and Dodel reports a rumor that a great deal of development for the old operating system is going on in Russia and Eastern Europe.

OS/2 users in North America tend to be older workers who learned to love the operating system when it was in business use. Most smaller OS/2 groups online have folded or morphed into multifaceted organizations encompassing alternatives to Microsoft, says Dodel.

About two years ago, Dodel heard

from a source in IBM that there were about 10 million OS/2 licenses under active support. Sun Microsystems sees gold in the stranded OS/2 community, which it numbers at 20 million users. The company has unveiled Project Mad Hatter to sell Linux desktops to OS/2 users.

OS/2 aficionados have been gathering annually in the U.S. since 1997 at Warpstock, a nickname for OS/2 that was borrowed from a Star Trek character. Europe quickly added its own edition of Warpstock.

Warpstock's venue changes from year to year—the event has been staged near Los Angeles and in Chicago, Atlanta, Philadelphia, Toronto, Austin, San Francisco and Denver so far—to make it more accessible.

"Each event is bid on by a local team of volunteers," says Dodel. "The only IBM folks involved are doing so on their own time."

Attendance at Warpstock events in North America peaked at about 400 in 1996 in Chicago. Last year was the first time the event drew fewer than 100 attendees, with significantly less participation from Europe than in the past. "Global politics isn't helping," Dodel says.

This year's U.S. Warpstock will be held in October in Hershey, Pa. Europe is putting on a pair of Warpstocks, one next month in the Czech Republic and one in November in Dresden, Germany. Last year's Euro Warpstock at-

tracted 150 attendees, with 56 coming from Germany and 53 hailing from the Netherlands.

OS/2 was widely used in banking, retail, telephony and manufacturing. Even today, many ATMs still use OS/2, as do some gas pumps and many industrial machines. "It's downright scary to think of something unreliable like any version of Windows doing these things," says Dodel.

Like a hot rodder with a classic Chevy, Dodel likes to talk about what's under OS/2's hood. "Ask just about any OS/2 user, past or present, what is great about OS/2, and most likely they will tell you the Workplace shell. It is a truly object-oriented desktop environment, and not a kludge like the Windows shell." And OS/2 has been immune to viruses, says Dodel, because OS/2 has no "mechanism for passing them on automatically."

Despite all these virtues, the OS/2 clock is ticking. The "VOICE Newsletter" had almost 900 subscribers in 1999-2000, but that number has dropped off to about 750. And the IRS has denied Warpstock Inc. nonprofit tax status because the event promotes a commercial product, even though IBM does "absolutely nothing" to officially support the product, according to Dodel. The most recent blow came when a vintage computer group told Dodel, who was planning an OS/2 museum for this year's Warpstock, that "OS/2 is too new to be considered vintage."

OS/2's savior could come from the East. Dodel says he has yet to speak with anyone from Lenovo but is anxious to start a dialogue about how OS/2 can liberate millions of PCs in Asia. ☎ 54736

BRIEFS

Meridian Launches Proliance for ILM

■ Meridian Systems in Folsom, Calif., announced Proliance 3.0. The Web-based information life-cycle management software is designed to integrate facility and project management functionality and is built on a service-oriented architecture. XML technology supports a workflow engine in the software that drives business process management across all Proliance applications, according to Meridian. The product also includes a business intelligence layer with key performance indicators, dashboards and rollout reporting. Pricing ranges from \$1,500 to 2,500 per seat.

Oracle Announces Financial Hub Tool

■ Oracle Corp. last week released its Financial Consolidation Hub. The product, which will be included in Oracle's Corporate Performance Management suite of analytic applications, is designed to automate the financial consolidation cycle, from data submission to the dissemination of consolidated results, according to the company. The hub, which is available now, is built on a unified enterprise data model that's used in all of Oracle's CPM applications. Pricing is \$50 per license with a minimum of 2,000 licenses.

AppRiver Unveils E-mail Service

■ E-mail security vendor AppRiver LLC in Gulf Breeze, Fla., has announced a new SecureTide e-mail management service that incorporates antispam, antivirus and content management tools. The product's content management tools allow monitoring and enforcement of e-mail usage policies without additional hardware or software, according to the company. SecureTide is priced at about \$675 per year for 50 users but will be available to existing AppRiver customers at no additional cost.

The Operating System As Cult Classic

NEGLECTED COMMUNITIES, be they small towns or virtual ecosystems, shrink and die in much the same way. Names and faces disappear, and real estate becomes empty.

In the physical world, over time, windows break, shingles tear off and loose items bang in the wind. Signs of atrophy appear more quickly in the virtual world. Web site links return the dreaded "Page cannot be found" screen, and the information that can be found is out of date and has clearly been neglected.

OS/2 user groups in the U.S. know neglect. They are diehards championing a doomed technology and maintaining their loyalty even as the operating system recedes from the IT landscape.

Most of the remaining physical user groups, as opposed to virtual organizations, are in Europe, where OS/2 still has a large presence, according to Mark Dodel, founding editor of the "VOICE Newsletter" (www.os2voice.org) for the OS/2 community.

A new cadre of younger OS/2 users in Europe, particularly in Germany, has started a small OS/2 renaissance as an alternative to Microsoft, and Dodel reports a rumor that a great deal of development for the old operating system is going on in Russia and Eastern Europe.

OS/2 users in North America tend to be older workers who learned to love the operating system when it was in business use. Most smaller OS/2 groups online have folded or morphed into multifaceted organizations encompassing alternatives to Microsoft, says Dodel.

About two years ago, Dodel heard

MARK DODEL, OS/2, is a 20-year IT industry veteran and journalist. He can be reached at markdodel@compuserve.com.

from a source in IBM that there were about 10 million OS/2 licenses under active support. San Micro-systems sees gold in the stranded OS/2 community, which it numbers at 20 million users. The company has unveiled Project Mad Hatter to sell Linux desktops to OS/2 users.

OS/2 aficionados have been gathering annually in the U.S. since 1997 at Warpstock, a nickname for OS/2 that was borrowed from a *Star Trek* character. Europe quickly added its own edition of Warpstock.

Warpstock's venue changes from year to year — the event has been staged near Los Angeles and in Chicago, Atlanta, Philadelphia, Toronto, Austin, San Francisco and Denver so far — to make it more accessible.

"Each event is bid on by a local team of volunteers," says Dodel. "The only IBM folks involved are doing so on their own time."

Attendance at Warpstock events in North America peaked at about 400 in 1998 in Chicago. Last year was the first time the event drew fewer than 100 attendees, with significantly less participation from Europe than in the past. "Global politics isn't helping," Dodel says.

HOW MANY PEOPLE DOES TO SUPPORT A SINGLE (THAT'S TOO MANY.)

With IBM® Express Servers and Storage™ designed for mid-sized businesses, help is here.

Servers should support a business, not the other way around. That's why IBM Express Servers have self-managing features, so that our servers can virtually run themselves. What's more, with IBM Express Servers and Storage, innovation comes standard. Take the OpenPower™ 710 Express, for instance. It's specially tuned for Linux® and offers the reliability of POWER5™ technology at a surprisingly low price.*

And while you can't be in two places at the same time, you might want to look into the innovative server feature that can. For example, the remarkable Advanced POWER™ Virtualization option – it lets one OpenPower 710 Express act as many virtual ones.

On top of that there's IBM TotalStorage® products, which offer a wide range of disk, tape, and storage software solutions – so you can choose the right options to meet the growing needs of your company.

There's also one more great feature – your IBM Business Partner. Which means you can talk to someone who understands your industry and your business – and who's located in your neck of the woods. And for mid-sized businesses, that's really big help in a really big way.

Tuned for Linux

IBM eServer OpenPower 710 Express

System features

- Increase computing power, availability and scalability in a rack dense environment
- Ideal for consolidation of infrastructure workloads (Web serving, file, print, security applications)
- Robust 64-bit mainframe-inspired POWER5 systems
- 2-way 19" rack server
- Up to 32GB of memory
- Optional Advanced POWER Virtualization*
- DB2® Express Discover CD
- Limited warranty: up to 3 years on-site*

From **\$4,477***

IBM Financing Advantage
Only **\$124** per month

IBM eServer OpenPower™

IBM TotalStorage®

Simplify storage management to improve productivity

IBM TotalStorage 3580 Express

The 3580 Express helps address your growing storage requirements and the problem of shrinking backup windows. It supports cost-effective backup, save and restore, and data archiving.

System features

- Built on Ultrium® 3 technology
- Read/write compatible with cartridges written by Ultrium 2 drives
- Read compatible with Ultrium 1 cartridges
- Up to 400GB cartridge capacity
- Up to 800GB with 2 to 1 compression
- Limited warranty 3 years*

From **\$5,850***

IBM Financing Advantage
Only **\$167** per month

IBM TotalStorage DS4300 Express

With a scalable design, the DS4300 Express is designed to provide a reliable and affordable storage option to help simplify your data management needs.

System features

- 2GB Fibre Channel SAN-ready
- 3U rack mount entry level
- Scales to 33.6TB
- Supports up to 112 Fibre Channel disk drives—with optional EXP710 expansion units
- Heterogeneous OS support
- Limited warranty 3 years on-site*

From **\$4,655***

IBM Financing Advantage
Only **\$238** per month

Got Questions About Enterprise Analytics?

Computerworld's IT Management Summit Has the Answers

Looking to better understand enterprise analytics? Apply to attend Computerworld's complimentary* half-day IT Management Summit: Beyond Business Intelligence.

Enterprise analytics enable companies to make timely fact-based decisions using critical information from across the entire organization. By fully leveraging data, technology, skills and processes, successful users of enterprise analytics go beyond simply understanding the past, to predicting outcomes that improve overall corporate performance.

This summit will feature the latest insights of business intelligence industry experts and will give you first-hand information on the innovations and experiences of companies successfully deploying enterprise analytics.

* Complimentary registration is restricted to qualified IT managers only.

Apply for registration today

WOW

IT is moving hotels into the 21st century. By Kathy Chin Leong

WHEN THE Mandarin Oriental, London, first opened its commercial 2009 Eo, flagship property had a total of \$40,000 per guest room. It's technology services. "There is nothing else we don't have in those rooms," insists Eric Cross, IT director at the 250-room hotel.

He's right. There are flat-panel LCD televisions in bedrooms and bathrooms, Cisco voice-over-IP telephones for voice and data communications, in-room faxes and printers. Games and video games, dual-side multimedia panels to plug in digital cameras, PCs, Apple iPods, wireless high-speed Internet access, DVD and CD players, wireless keyboards to turn televisions into monitors and even docking stations to simplify MP3 players.

"What we have implemented will be the standard for all our new properties from now on," says Cross.

At the core of the design is the blueprint for a new integrated voice and data network that runs over IP. Hong Kong-based Mandarin Oriental International Ltd. expects the technology to last for the next eight to 10 years.

Hotels are moving into the 21st century, electrifying rooms with enough of a high-tech "wow" factor to keep guests coming back. With more than 15 million guests, a major technology to Digital Information Line service, hotel management also must keep competing with the technology that guests use a daily home web site.

In addition, hotel management must keep up with the technology that guests use a daily home web site.

WWWW

IT is moving hotels into the 21st century. By Kathy Chin Leong

BEN THE Mandarin
Oriental in New York opened in November 2003; the flagship property had invested \$40,000 per guest

room for technology services. "There is nothing that we don't have in those rooms," boasts Eric Cruz, IT director at the 251-room hotel.

He's right. There are flat-panel LCD televisions in bedrooms and bathrooms, Cisco voice-over-IP telephones for voice and data communications, in-room faxes and printers, Xboxes and video games, desk-side multimedia panels to plug in digital cameras, PCs, Apple iPods, wireless high-speed Internet access, DVD and CD players, wireless keyboards to turn televisions into monitors and Bose docking stations to amplify MP3 players.

"What we have implemented will be the standard for all our new properties from now on," says Cruz.

At the crux of the design is the blueprint for a fully integrated voice and data network that runs over IP. Hong Kong-based Mandarin Oriental International Ltd. expects the technology to last for the next eight to 10 years.

Hotels are moving into the 21st century, electrifying rooms with enough of a high-tech "wow" factor to keep guests coming back. With more than 15 million North Americans subscribing to Digital Subscriber Line service, hotel executives know they must offer computing and communications services on par with what guests use in their homes and offices.

In addition to guest-room enhancements, fundamental computing and networking changes are reshaping office operations in the \$16-billion U.S. hotel industry. Hotels are chucking older systems in favor of Web-based applications that integrate data so employees can obtain a guest profile without looking up 30 different files across 30 applications, says Doug

Rice, president of Hotel Technology Next Generation in Inverness, Ill. Nine hotel IT executives formed IT N3 in 2003 to encourage their peers and vendors to work together to successfully provide hotel technology. Key players include Marriott International Inc., Global Hyatt Corp. and Mandarin Oriental.

"The problem in our industry is that there are so many fragmented buyers and suppliers," Rice says. "A hotel can have as many as 50 different systems, and none of them talks to each other."

The primary hotel applications center includes property management, customer reservations and call center systems, he says. "When these systems are not connected, it's interface hell."

And progress takes time. "It took 30 years to create the problem, correcting it won't happen overnight," Rice says.

ITN3 has organized working committees to address interoperability issues in cooperation with Washington-based Open Travel Alliance Inc., a similar industry group for the travel business.

No one knows exactly how much U.S. hotels spend on IT, but Rice cites estimates of \$25 billion worldwide for all computer, hardware, telephony, television and support costs. Global spending in the industry will probably increase about 5% this year, the same as hotel growth, he says.

Fortunately, hoteliers who are savvy in technology and business see the big picture. They understand that operating older, nonintegrated systems is

inefficient and costly.

Major brands such as Marriott, Hilton Hotels Corp. and Fairmont Hotels & Resorts Inc. are launching and implementing initiatives to integrate their applications into a seamless whole, and some are purchasing or building their own Web-enabled applications. Franchised brands hope to break even as franchisees pay for contracted IT services. Hotels that own all of their properties see the efficiencies as necessary to keep up with the competition and streamline costs.

Consolidating for Clout

Jerome-based Fairmont Hotels is halfway through a three-year plan to overhaul its systems. Prior to this brandwide implementation, each Fairmont hotel purchased its own hardware and software, with no common standards or influence from the corporate IT department, says Vince Gupta, Fairmont Hotels' vice president of IT. Now, the chain's consolidated approach means that it will have more buying clout.

Even so, Gupta says that with an annual technology budget of less than \$50 million, Fairmont plans to write its own applications in Java. The new Web-based, integrated applications will save on maintenance and travel costs, since new updates will be available for downloading online.

Elsewhere, Hilton's OnQ has become famous in hotel IT circles. The Web-based, \$90 million customer hardware and software platform was intro-

duced in 2000 by Beverly Hills, Calif.-based Hilton and supports 2,280 U.S. Hilton properties.

OnQ includes 10 highly woven applications that support seven major business components, including distribution services, the call center, customer reservation management, the Honors loyalty program, property management, and sales and marketing.

Like other large hoteliers, Hilton puts IT near the top of the organizational chart. Tim Harvey, the company's CIO, reports directly to CEO Steve Ballkebach. "Technology is important enough to be recognized at that level," Harvey says.

At Washington-based Marriott, a three-to-five-year plan calls for reconfiguring the hotel's networking technology. Barry Shuler, vice president of IT strategy, and Lou Paladino, business technology vice president, are executing the plan with a global IT staff of 1,200 full- and part-time workers.

Marriott's plan began with a video Shuler and Paladino put together to show general managers, franchisees, owners and construction teams the benefits of moving to a converged network.

"We have a lot of separate cables, back-office local-area networks, lots of security networks," Shuler says. "We want a single network that will take care of everything using the IP protocol."

Marriott intends to roll out fiber-optic cable that supports cell phone service, back- and front-office networking and Wi-Fi radio. Marriott also

plans to develop its own set of Web-based applications to run its hotels. In the million of in-room amenities, technology is a given, notes Rice. "If you don't have Internet access, you're in trouble," he says.

Still, dropping support for older technologies requires care. For example, while Wi-Fi is a must, hotels shouldn't get rid of their in-room calling investments just yet, says Mark Hedley, CIO at Wyndham International Inc. in Dallas. Having both can come in handy. "Certain government agencies and pharmaceutical companies do not want information going across Wi-Fi for security reasons," he explains. "Their employees have to use wired connections."

Other technologies provide in-room entertainment. This summer, Rancho Bernardo Inn in San Diego will feature Bose Wave high-fidelity radios from Framingham, Mass.-based Bose Corp. with MP3 support and Zvex all-in-one audio amplifiers from Swampscott, Mass.-based Zvex Audio LLC. "People can bring in their iPods and use the Zvex," explains Jason Durbin, business project coordinator. "The sound is just incredible. Having technology is a great sales tool for us."

More Bells and Whistles

In New York, a recent \$400,000 investment, including fiber-optic network and broadcast equipment, enables Mandarin Oriental to broadcast events worldwide via satellite.

"We will be able to help a TV station

INSIDE The Room

AT THE BALTIMORE Marriott Waterfront Hotel, nearly 27 rooms are the crime de cuisine of high-tech guest perks for the \$10 billion corporation. Starting next month, patrons who stay there will be able to plug their laptops, iPods, video game systems, camcorders or other devices into a single four-plug connectivity panel.

It's not just an outlet, mind you. It's the JackPack, a panel with enough wires to know which device is plugged where and route information to the room's state-

of-the-art, 32-in. flat-panel, high-definition video screen from LG Electronics Inc.

When a guest connects a device to the JackPack, it registers the device and then displays a window on the television to allow the guest to control the viewing, listening or playing experience.

Marriott co-developed the JackPack and television with LG Electronics and will have exclusive use of the technology for the next two years. The hotel expects to roll out 50,000 sets over the next four

years at its full-service properties, says Barry Shuler, senior vice president of IT strategy.

According to Shuler, determining the needs of future guests is essential for today's IT strategy. Guest rooms are being transformed into places where business travelers can do "relaxing work," says Lou Paladino, vice president of business technology at Marriott.

Toward that end, rooms in several Marriott hotels feature special task lighting, business desks with tabletops that pivot, ergonomic work chairs, and wired and wireless Web access.

In the future, a guest may not even have to bring his laptop; he may use his memory stick as a virtual drive and load it into an interface on the television to do work, Paladino says.

High-tech hotel rooms come with all the modern amenities.

At the Hilton Garden Inn in El Segundo, Calif., the guest rooms are loaded for new technologies. One features a thumbprint entry panel in lieu of a card-key reader, and a switch pad near the bed that allows the guest to centrally control lighting, temperature, the tele-

vision and window shades.

"Technology is great when you are something that gives people a pleasant surprise," says Hilton CIO Tim Harvey. "My IT people say what gives them the biggest result is seeing that customers smile."

—Kathy Chin Leong

or company set up an event and send it on a live satellite feed within an hour," Cruz says. "We already have the cabling." Today, event promoters typically require days to get city permits for temporary cabling and set it up.

"No one else has anything like this," says Cruz. "Direct-fiber broadcasting is a brand-new capability. TV crews can plug their cameras right into the infrastructure and air a conference from anywhere in the hotel—even one of the hotel rooms."

Although the Mandarin hotel is a showcase for bells and whistles, IT managers agree that the point of technology services is to enhance guests' stay, not overwhelm them.

"We don't want you to think that technology is in your face," says Shuler, "but we want you to have it there when you want it." **Q 54548**

Leong is a freelance writer in Sunnyvale, Calif. Contact her at kchinn@leong.a.sheglobe.net

OUTSIDE The Room

SOME LARGE HOTELS are also experimenting with guest-focused technology outside the rooms. At Honolulu Airport, four touch-screen kiosks in the baggage areas are part of a Hilton pilot project. The kiosk system, developed by IBM, enables travelers to use their credit cards to check into the Hilton Hawaiian Village Beach Resort & Spa, select rooms and obtain room keys on the spot.

Marrion has piloted wireless check-in kiosks that can be

placed anywhere as optional check-in points. It's also evaluating wireless technologies that will enable guests to check in remotely from their handhelds or cell phones.

Wyndham International has used IT to fine-tune its guest loyalty program. When guests fill out Wyndham ByRequest forms online, the data is automatically recalled the next time they book a room at a Wyndham hotel.

The ByRequest question-

naire also asks the guest to state his preferences regarding options such as room location, bed size, music, wine, juices, reading materials and pillows.

A Hilton kiosk aids check-in.

The IT department has integrated the ByRequest data across Wyndham's reservations, property management, sales and distribution systems, so all areas have a complete customer record. When the guest is scheduled to check in, the system alerts hotel clerks that he prefers leather pillows and likes champaign in his room when he arrives.

"We created this program based on highly personalized service," says Mark Herdley, Wyndham's COO. "We worked tightly with the sales, technology and marketing people to make this successful."

So far, more than 2 million guests have joined the program. —Kathy Chin Leong

and then it hits you://

And progress takes time. "It took 30 years to create the problem; correcting it won't happen overnight," Rice says. HTNG has organized working committees to address interoperability issues in cooperation with Washington-based Open Travel Alliance Inc., a similar industry group for the travel business.

No one knows exactly how much U.S. hotels spend on IT, but Rice cites estimates of \$25 billion worldwide for all computer, hardware, telephony, television and support costs. Global spending in the industry will probably increase about 5% this year, the same as hotel growth, he says.

Fortunately, hoteliers who are savvy in technology and business see the big picture. They understand that operating older, nonintegrated systems is

inefficient and costly.

Major brands such as Marriott, Hilton Hotels Corp. and Fairmont Hotels & Resorts Inc. are launching and implementing initiatives to integrate their applications into a seamless whole, and some are purchasing or building their own Web-enabled applications. Franchised brands hope to break even as franchisees pay for contracted IT services. Hotels that own all of their properties see the enhancements as necessary to keep up with the competition and streamline costs.

Consolidating for Clout

Toronto-based Fairmont Hotels is halfway through a three-year plan to overhaul its systems. Prior to this brandwide implementation, each Fairmont hotel purchased its own hardware and software, with no common standards or influence from the corporate IT department, says Vineet Gupta, Fairmont Hotels' vice president of IT. Now, the chain's consolidated approach means that it will have more buying clout.

Even so, Gupta says that with an annual technology budget of less than \$50 million, Fairmont plans to write its own applications in Java. The new Web-based, integrated applications will save on maintenance and travel costs, since new updates will be available for downloading online.

Elsewhere, Hilton's OnQ has become famous in hotel IT circles. The Web-based, \$90 million custom hardware and software platform was intro-

duced in 2000 by Beverly Hills, Calif.-based Hiltoto and supports 2,250 U.S. Hilton properties.

OnQ includes 10 tightly woven applications that support seven major business components, including distribution services, the call center, customer reservation management, the Honors loyalty program, property management, and sales and marketing.

Like other large hoteliers, Hiltoto puts IT near the top of the organizational chart. Tim Harvey, the company's CIO, reports directly to CEO Steve Bollenbach. "Technology is important enough to be recognized at that level," Harvey says.

At Washington-based Marriott, a three-to-five-year plan calls for re-vamping the hotel's networking technology. Barry Shuler, vice president of IT strategy, and Lou Paladino, business technology vice president, are executing the plan with a global IT staff of 1,200 full- and part-time workers.

Marriott's plan began with a video Shuler and Paladino put together to show general managers, franchisees, owners and construction teams the benefits of moving to a converged network.

"We have a lot of separate cables, back-office local-area networks, lots of security networks," Shuler says. "We want a single network that will take care of everything using the IP protocol."

Marriott intends to roll out fiber-optic cable that supports cell phone signaling, back- and front-office networking and Wi-Fi radio. Marriott also

plans to develop its own set of Web-based applications to run its hotels.

In the milieu of in-room amenities, technology is a given, notes Rice. "If you don't have Internet access, you're in trouble," he says.

Still, dropping support for older technologies requires care. For example, while Wi-Fi is a must, hotels shouldn't get rid of their in-room cabling investments just yet, says Mark Hedley, CIO at Wyndham International Inc. in Dallas. Having both can come in handy. "Certain government agencies and pharmaceutical companies do not want information going across Wi-Fi for security reasons," he explains. "Their employees have to use wired connections."

Other technologies provide in-room entertainment. This summer, Rancho Bernardo Inn in San Diego will feature Bose Wave high-fidelity radios from Framingham, Mass.-based Bose Corp., with MP3 support and Zvox all-in-one audio amplifiers from Swampscott, Mass.-based Zvox Audio LLC. "People can bring in their iPods and use the Zvox," explains Jasoo Durbin, business project coordinator. "The sound is just incredible. Having technology is a great sales tool for us."

More Bells and Whistles

In New York, a recent \$400,000 investment, including fiber-optic network and broadcast equipment, enables Mandarin Oriental to broadcast events worldwide via satellite.

"We will be able to help a TV station

or company set up an event and send it on a live satellite feed within an hour," Cruz says. "We already have the cabling." Today, event promoters typically require days to get city permits for temporary cabling and set it up.

"No one else has anything like this," says Cruz. "Direct-fiber broadcasting is a brand-new capability. TV crews can plug their cameras right into the infrastructure and air a conference from anywhere in the hotel — even one of the hotel rooms."

Although the Mandarin hotel is a showcase for bells and whistles, IT managers agree that the point of technology services is to enhance guests' stay, not overwhelm them.

"We don't want you to think that technology is in your face," says Shuler, "but we want you to have it there when you want it." **Q 54548**

Oil AND Water

[BY MATT HAMBLIN]

NETWORK CONVERGENCE MAY BE A CHALLENGE, BUT
INTEGRATING VOICE AND DATA PERSONNEL IS EVEN HARDER.

WHEN Craig Hinkley at Bank of America Corp. in Charlotte, N.C., first brought voice and data workers together for a three-year VoIP project that would affect 180,000 users, the room divided, and "the voice and data guys set up caries and started lobbing grenades," says the senior vice president of network architecture.

As more companies start down the winding road to converging voice and data communications, it's ironic that the first obstacle they hit isn't a technical hurdle but a human one. That's because converged network projects work best when companies get voice engineers under the same management umbrella as the data team, which means the CIO takes charge of the voice side of the corporation.

Sounds easy enough, even logical. You simply convene a campfire in a rustic setting and have the voice and data teams sit together singing "Kumbaya," right?

Not exactly, say some IT managers who have been through the process and lived to talk about it. The fact is, because the separation of the two teams is so ingrained in tradition, the CIO's attempt to don the chief telephony officer's hat is fraught with corporate politics.

And because voice and data people don't usually work together, they tend to have different work styles and personalities. One observer compares the differences between the two teams to those between *Animal House*-type

fraternity members and dormitory residents, with the former setting up messy data-switching closets while the latter tend well-organized voice-switching closets. The data folks might be stereotyped as rebels on hot rods, while the voice workers are country-clubbers in sedans.

Despite these differences, bringing the two workforces together is essential to successful convergence projects, analysts and IT managers say. And as time goes on, more companies will be

dealing with the issue as they update their aging circuit-switched phone systems and increasingly opt for an IP converged network to support applications that mix voice with traditional data applications such as e-mail.

Recognizing Differences

A good start to achieving harmony is understanding the two groups' very different perspectives. Data workers tend to focus on data availability and reliability, not the millisecond time delays that annoy voice users, says Clay Swenson, a VoIP project manager at GlaxoSmithKline PLC in Durham, N.C., where a pilot convergence project is under way.

For their part, voice personnel understand the need to eliminate that millisecond delay, but they have to adjust to making voice "just another application" in a data network with voice over IP, according to Swenson.

At many companies, voice teams have been traditionally lumped under the facilities group in the organizational chart and charged with maintaining the copy machines as well as the phones, Swenson says. The data teams, on the other hand, work for the CIO and have been rulers of the server domain, operating in a world less in tune with immediate user needs.

For example, when a voice circuit

goes down, users are instantly up in arms, but when a data system goes down, it may take a while to affect their work, so they may not immediately notice.

To neutralize these differences, the pharmaceutical giant set up virtual teams of voice and data workers that will collaborate at least until VoIP is rolled out globally throughout the organization.

At Bank of America, Hinkley says he observed that the teams have a "natural distrust" of each other, with voice workers tending to be older than those in the data group and each being accustomed to different ways of getting things done. That's why Bank of America started bringing the

groups together slowly with meetings and top-level discussions of what skills were needed for the VoIP project.

Bank of America has relied on a structure that happens to be similar to what analysts at Gartner Inc. recommend. The bank separates VoIP infrastructure services teams from VoIP application services teams, and each group includes people with both data and voice skills. In addition, each of those teams needs to operate with a security team, Hinkley says.

The model at Bank of America helps define the roles of voice and data engineers, he says, "which helps both camps realize that each has responsibilities to make sure the IP environment is successful."

Hinkley also advises engaging in cross-training. "If I were a traditional voice engineer, I'd be cross-pollinating my skill set with IT practices and understanding of data network components," he says.

That doesn't mean that voice engineers need to become network design engineers, he adds, but they should understand the key components of data networking.

As for data engineers, they need to understand the importance of real-time communications and its effect on network design, since VoIP arguably provides the first test of using data networks to meet the needs of real-time communications with voice, Hinkley says.

Turf Issues

Experienced managers also advocate throwing the voice and data groups together more than they're used to, whether through meetings and other gatherings or even by moving their

Key Jobs

To ensure a successful VoIP network convergence rollout, Gartner advises organizations to merge their existing voice teams with other IT functions. Here are the key job groups Gartner says convergence teams should include, as well as some of their duties:

■ **VOICE SPECIALISTS.** These workers tend to come from the telecommunications manager ranks and have experience recognizing different types of users in the company, as well as cultural and regional differences in global organizations. They must have the vision to plan for developments in voice such as IP telephony and Session Initiation Protocol.

■ **NETWORK DESIGNERS AND MANAGERS.** This group recognizes that voice needs to be included in the host of applications supported by design architects. It identifies specifications defined by voice specialists and handles network reliability, latency and quality of service.

■ **SECURITY SPECIALISTS.** Members of this group need to work with voice team specialists as actively as they work with data networking teams. IP telephony, which is a network endpoint, must ultimately comply with network-access security policies defined by security specialists.

DAVID REYNOLDS

cupicles closer together.

That's sound advice, according to Janet Smith, a consultant at Janet Smith & Associates in Chapel Hill, N.C. Smith combined the voice and data teams at an academic medical center where she worked in a prior job, but she found that it wasn't easy to get the two groups to play nicely together. "It's a very difficult nut to crack," she says.

"The telecom workers sense that they almost always lose in these convergence situations, and the telecom team is not eager to give up its territory," Smith says. And because the CIO is often from the data tradition, he may have difficulty valuing telecommunications workers and their experience in dealing with people as opposed to technology, Smith adds. It helps if the CIO recognizes that difference and addresses it with both groups.

Even if you don't have an IP telephony project in the works, Smith advocates merging the voice and data

teams. And that doesn't mean just changing the organizational chart so that telecommunications reports to the CIO, she adds. Voice and data staffers need to work alongside one another in the same work space, with the integrated teams focused on three areas: infrastructure, applications and customer-facing functions.

But before merging the teams, companies need to have common procedures and methods in place for both groups to handle job orders (such as a phone for a new employee), as well as change and problem management, inventory tracking and asset management. Some of these processes are standardized in systems management software packages.

If convergence is really working, Smith adds, your company has a single number for users to call for help, whether the problem is with a PC, a phone or other technology, such as a workgroup copier.

Smith's advice is mirrored by other

analysts, including those at Gartner, who recently urged in a report that CIOs merge their voice teams with other key IT functions. Gartner compared VoIP to CRM initiatives, which require cross-business cooperation to be effective. It said that if telephony isn't the responsibility of those planning the network infrastructure needed for real-time communications, a company will be unable to maximize the benefits of new technologies.

VoIP convergence might require companies to retrain or recruit workers with new skills in order to build a communications team with voice specialists, network designers and managers, and security specialists, the report says (see box, page 40).

"The IP telephony decision needs executive sponsorship due mainly to political issues, and the three teams must cooperate," says Lawrence Orans, one of the authors of the Gartner report. "Otherwise, the project will be doomed." ■ 54571

RAIN BORN? IT'S A FISHY BUSINESS

The Problem with Open-Door Policies

STEAL THIS IDEA

Sometimes, so many people are lined up at your "open door" that you, the manager, can't get any work done. Plus, an open-door policy trains your staff to come to you with all of their problems instead of solving them on their own.

Tom Foster, a Fort Lauderdale, Fla., management consultant who writes a blog called Management Skills (www.managementblog.org), has identified a couple of ways to deal with the problem.

"On the wall behind the swivel chair of one of my favorite clients is posted the following phrase: 'What are you going to do about that?'" Foster says. "The next time one of your team members enters

your open door with a problem they wish you would solve for them, try this response: 'That's curious - what are you going to do about that?'"

It may sound harsh, but managers should be building a team that can come up with solutions, he says.

"One of my clients printed up a small pad of paper that he kept on the corner of his desk. Whenever a team member arrived with a problem, he ripped off the top sheet and sent them to the conference room for 10 minutes," Foster says. Here's what the sheet said:

What do you think is causing the problem?

Name three solutions that might solve the problem.

Which is the best solution that might solve the root cause of the problem?

The result is that staffers come to you with solutions instead of problems.

Many Unhappy Returns

By Charles D. Rossett

Many Unhappy Returns: One Man's Quest to Turn Around the Most Unpopular Organization in America, by Charles D. Rossett (Harvard Business School Press, 2005)

You think you've got problems. On Charles Rossett's first day as commissioner of the Internal Revenue Service in 1997, he thought it would be nice to send an introductory e-mail to all IRS employees. The staff just smiled. There was no IRS e-mail system. "I could send an e-mail to others in my Washington office, but all of the other offices had their own e-mail systems, or had none at all," he recalls.

Rossett, the first businessman and technologist to lead the IRS, described his efforts to reform an agency that manages a \$2 trillion tax system with

100,000 demoralized employees, antiquated technology (a core system dates back to 1962) and zero respect. It didn't help that the IRS previously had wasted \$4 billion on a botched IT overhaul. It seemed like an impossible turnaround job, but Rossett left the IRS a better place in 2002 and, in this book, offers hard-won lessons for managing successful change.

— Mitch Betts

Things to Ponder

The No. 1 problem with database marketing isn't technology related: it's the lack of sufficient staff to analyze all the data, according to a Forrester Research Inc. survey of 124 U.S. retail marketers.

Twenty-six percent of online households are getting e-statements from their financial providers, says another Forrester report. "The only problem is that 97% of e-statement adopters continue to receive a paper statement," the report says, because consumers want the paper for their records and don't see a compelling reason to give it up. "Times must wean consumers from their addiction to paper by offering a printable statement in

PDF format, automatically turning off paper statements for e-statement adopters and charging customers who request a paper statement via snail mail," the report concludes. ☐ 5477

The IT Economy

One way to reduce complexity in your IT shop is to cut down on the number of IT vendors you do business with. And according to a recent survey, 50% of IT managers are doing just that.

SOURCE: IDC'S VENDOR REDUCTION SURVEY, SOURCE: IDC, MAY 10, 2005, PAPER 20050501

Buying Intentions

IDC researchers say their index of business IT demand (bottom) shows that user spending expectations have slipped again. "For many of the last six months, user expectations were overly optimistic," says John Gantz, IDC's chief research officer. "But slowly the outside world seems to have sunk in. Corporate profits are good, but IT spending is good. Consequently, the IT spending climate is good, but not that good."

Source: IDC's Business IT Demand Index, May 10, 2005, PAPER 20050501

The Index based index is based on monthly surveys of 400 to 500 U.S. CIOs and IT managers worldwide. They are asked about their IT spending expectations for the next 12 months. Results are weighted to be representative of the U.S. market. An index of 1,000 means zero growth. Caution: Rising intentions don't always lead to real spending.

Career Watch

Q&A

We've heard for years that soft skills are of increasing importance to IT professionals. Is this an accelerating trend? With companies' increasing reliance on technology to support and drive their business, the role of the IT professional has become much more prominent. You are now frequently looked to for strategic guidance and one-to-one support. It's common today, for example, for those in IT to be asked to make a case for or against a particular sort of upgrade or hardware purchase, and this requires excellent communication skills, the power of persuasion and a fundamental understanding of the firm's business needs. As a result, soft skills are playing a larger role in an IT candidate's professional development and advancement today than at any time in the past.

Will there soon be no place left for the hard-core techie with antiseptic tendencies - the stereotypical coder with a

heart of steel and nerves? Opportunities will remain for purely technical professionals, but the workplace is increasingly team-oriented. If you can't work well with others, your options can be limited. Keep in mind, too, that because companies require IT staff to take a more strategic and collaborative approach than in the past, soft skills are playing a larger role in an IT candidate's marketability and are frequently a deciding factor when evaluating two individuals with otherwise equal qualifications.

Are schools recognizing the need for strategic thinking and interpersonal skills in today's IT pros? How are they meeting this need? Of course, broad-based general education has always been part of a four-year curriculum at most universities. But increasingly, administrators of computer science and information systems-related programs are recognizing and addressing the need for nontechnical skills development. They're beginning to expand their programs to include a more well-rounded curriculum, including instruction in areas such as business, finance and marketing.

What is surprising, however, is that many companies are not offering this kind of training to their own IT staff. In a recent survey commissioned by our company, nearly half - 47% - of 1,400 CIOs polled said their companies do not provide IT professionals with instruction in business and communication fundamentals. Many firms faced with an immediate need for technology expertise and limited budgets for professional development opt to support technical training instead. While these managers may perceive soft skills as less critical, they're missing out on an opportunity to enhance the team's productivity as well as their ability to collaborate on solving everyday challenges. © 54344

FIRST THINGS filled overworking, with companies giving up some of the work, that even IT shops had performed to domestic service providers. Then came offshoring, in which work was outsourced to distant, low-wage places like India. Coming next: Well, you could call it offshoring, a business plan that involves using software engineers who aren't where when they work.

SeaCode Inc. is a San Diego-based company that plans to put as many as 800 developers, mostly from countries such as India, aboard a cruise ship moored in international waters off the coast of California and linked to the mainland by a T3 line. The company's principals say they won't provide the cheapest development work, since they plan to pay two to three times the going rate for foreign IT talent, indeed. They will offer services at a lower cost than can be found in the U.S., and to a more convenient location than Asia for most companies, better enabling them to stay in contact with the people doing the coding.

The proposal has drawn fire from several directions, with one publication dubbing the floating operation a "swimming" and low-costed commentators calling for "inflation." Michael Hittall in the *Los Angeles Times* recalled the floating person hells that beset the concept Alvin Karpovich in *Over Expectations*.

But Hittall ends up taking a more sanguine view, noting that the developers will be well paid relative to the standards of their homelands; that they will be at sea for four months and then be given two months off at home, with salary paid by SeaCode; and that they will presumably be able to take shore leave on the U.S. mainland, if their paperwork is in order.

Still, this idea isn't likely to play well among people who already take a dim view of the offshoring band. One Internet posting even speculated that the ship's proximity to Los Angeles could make it a tempting target for angry web-off developers.

Lenses on
Leadership

BEFORE THE DAYS OF PHOTOSHOP, it was common to say that photographs don't lie. But even way back when, during the dark ages of chemical film, photographers used different lenses and filters to change colors, highlight some details over others and bring some subjects into sharp focus while blurring others. Pictures lie and tell the truth all at once.

Managers use mental lenses and filters for many of the same reasons. They look at the world through them to color facts, highlight some more than others and bring some subjects into sharp focus while blurring others. A manager's picture of reality lies and tells the truth all at once too.

In fact, most of us learn to use one filter quite well; we call it our point of view. After first joining the workforce, we typically try out a few viewpoints, figuring out which ones bring useful insights, praise and career rewards. Eventually, we settle on the one that seems to work best and start to use it almost exclusively. Before long, we forget that there ever were other perspectives at all.

This isn't such a bad thing. Filters help us make sense of the complexity of daily life. They simplify the confusion and help us to make meaning of the disparate facts and feelings that relentlessly assault us.

But as our responsibilities expand and we change jobs and take on supervisory, managerial and leadership roles, it becomes easy to keep using the same old perspectives that have served us so well in the past. Unless we examine the lessons we learned as

junior programmers, we continue to apply them to the responsibilities now confronting us as CIOs. That doesn't always work so well.

I've noticed that for IT managers, there are a few lenses that tend to be common.

The accountant's green eyeshade: Through the green shade, every question looks like a budget issue. Schedule problems are primarily viewed as budget problems. Quality is seen only dimly, and human resource concerns are barely visible at all.

The conductor's watch: Through the conductor's lens, every issue looks like a schedule challenge. For the conductor, time is a constant, urgent threat. If we're ahead of or just on schedule, we're OK, but anything that comes up can knock us off the precious and unforgiving timetable.

The mogul's ambition: For the Trump in training, all things look like confirmation of, or threats to, the manager's power and span of control. Every event and fact is inspected for its effect on the authority and personal success of the mogul. Through this lens, human relationships are highlighted, since power is exercised only on others, and people are separated into

opposing camps of friends and enemies. Budgets are symbols of power, and schedules are weapons to wield.

The aesthete's frame: For the aesthete, everything either enhances or detracts from the elegance of the world. Technology is a beautiful thing. Building beautiful things is the highest good to which one can aspire. Time and money are petty concerns that pale in comparison to the advancement of human expression. IT people are the artists who give birth to the creative work.

The hero's journey: From the hero's perspective, everything seems like part of a courageous narrative starring the manager as Odysseus. The arc of the narrative guides the interpretation of the facts. The clash between good and evil is ultimately resolved through a climactic conclusion. Supporting characters populate projects, and events either serve as twists and turns in the story or are disregarded as part of another narrative.

The samurai's quest: In this view, everything looks like part of a grand battle strategy, and the opportunity to serve is the greatest honor of the staff. The manager is the loyal samurai, faithfully serving his master. Managers are most effective when they:

1. Know which lenses come naturally to them.
 2. Can recognize when others are looking through different lenses.
 3. Can adopt whichever lens is most informative and useful at a given moment. Leaders with flexible perspectives are able to adjust to reality rather than trying to adjust reality themselves.
- The manager or photographer who is willing to use only one lens filters out the complexity of reality and limits his effectiveness. ☐ 54348

Career Watch

We've heard for years that soft skills are of increasing importance to IT professionals. Is this an accelerating trend? With companies' increasing reliance on technology to support and drive their business, the role of the IT professional at has become more prominent. You are now frequently looked to for strategic guidance and one-to-one support. It's common today, for example, for those in IT to be asked to make a case for or against a particular sort of upgrade or hardware purchase—and this requires excellent communication skills, the power of persuasion and a fundamental understanding of the firm's business needs. As a result, soft skills are playing a larger role in an IT candidate's professional development and advancement today than at any time in the past.

Will there soon be no place left for the hard-core techs with antiseptic tendencies—the stereotypical coder with a

heart of ones and zeros? Opportunities will remain for purely technical professionals, but the workplace is increasingly team oriented. If you can't work well with others, your options can be limited. Keep in mind, too, that because companies require IT staff to take a more strategic and collaborative approach than in the past, soft skills are playing a larger role in an IT candidate's marketability and are frequently a deciding factor when evaluating two individuals with otherwise equal qualifications.

Are schools recognizing the need for strategic thinking and interpersonal skills in today's IT pros? How are they meeting the need? Of course, broad-based general education has always been part of a four-year curriculum of most universities. But increasingly, administrators of computer science- and information systems-related programs are recognizing and addressing the need for nontechnical skills development. They're beginning to expand their programs to include a more well-rounded curriculum, including instruction in areas such as business, finance and marketing.

What is surprising, however, is that many companies are not offering this kind of training to their own IT staff. In a recent survey commissioned by our company, nearly half—47%—of 14,000 CIOs polled said their companies do not provide IT professionals with instruction in business and communication fundamentals. Many firms faced with an immediate need for technological expertise and limited budgets for professional development opt to support technical training instead. While these managers may perceive soft skills as less critical, they're missing out on an opportunity to enhance the team's productivity as well as their ability to collaborate on solving everyday challenges. **☎ 54344**

FIRST THERE WAS outsourcing, with companies greing up some of the work their own IT shops had performed to domestic service providers. Then came offshoring, in which work was outsourced to distant, low-wage places like India. Coming next? Well, you could call it offshore offshoring, a business plan that involves using software engineers who aren't ashore when they work.

SeaCode Inc. is a San Diego-based company that plans to put as many as 600 developers, mostly from countries such as India, aboard a cruise ship moored in international waters off the coast of California and linked to the mainland by a T3 line. The company's principals say they won't provide the cheapest development work, since they plan to pay two to three times the going rate for foreign IT talent. Instead, they will offer services at a lower cost than can be found in the U.S. and in a more convenient location than Asia for most companies, better enabling them to stay in contact with the people doing the coding.

The proposal has drawn fire from several directions, with one publication dubbing the floating operation a "sweatshop" and less-colourful commentators settling for "inhumane." Michael Hitzek in the *Los Angeles Times*—called the floating prison hulks that housed the convict Abel Magwitch in *Great Expectations*.

But Hitzek ends up taking a more sanguine view, noting that the developers will be well paid relative to the standards of their homelands, that they will be at sea for four months and then be given two months off at home, with airfare paid by SeaCode, and that they will presumably be able to take shore leave on the U.S. mainland, if their paperwork is in order.

Still, this idea isn't likely to play well among people who already take a dim view of the offshoring trend. One internet posting even speculated that the ship's proximity to Los Angeles could make it a tempting target for angry laid-off developers.

—Janice Eckle

Succession Failures

Executive recruiting firm Korn/Ferry International asked 201 of its consultants what they believe is the most common succession-planning mistake that organizations make.

TECH EMPLOYMENT RISES

Computer employment in the United States rose 1.1% in April 2005, according to a new survey by the Bureau of Economic Analysis. The report shows that the number of people working in the computer industry has increased by 1.1% since the last survey in March 2005. The report also shows that the number of people working in the computer industry has increased by 1.1% since the last survey in March 2005.

EXEC TRACK

Prudential Names
Susskind CIO

Prudential Financial Inc. in Newark, N.J., announced that EMILY SUSSKIND has been appointed CIO of its international division. She will be responsible for the strategic direction of IT in Prudential's insurance and investment operations. Prior to joining Prudential, Susskind was executive vice president at Sony Corp. She was also previously a senior vice president at Dow Jones Markets and Tele-TV Systems and held a series of positions at Salomon Brothers Inc., including director of global networking.

Sara Lee Appoints
Chappelle as CIO

Sara Lee Corp. in Chicago announced the appointment of GEORGE CHAPPELLE to the new position of CIO. He will report to the chief financial and administrative officer. Chappelle previously was CIO at H.J. Heinz Co. Prior to that, he held a variety of management positions at ABB Group and The Gillette Co.

Evans to Lead IT
At Jobing.com

Phoenix-based Jobing.com LLC, a local-focused employment Web site, announced the appointment of DAVID EVANS as CIO. Evans previously served as vice president of product at Information Technology Toolbox Inc. and director of marketing development at Cendant Corp.

Cameron Is COO
At VantageMed

VantageMed Corp., a maker of health care software in Rancho Cordova, Calif., has promoted CIO MARK CAMERON to chief operating officer. Prior to joining VantageMed, Cameron was a senior vice president of product development at Bech Street Corp. and vice president of production services at WebMD Corp.

Lenses on
Leadership

BEFORE THE DAYS OF PHOTOSHOP, it was common to say that photographs don't lie. But even way back when, during the dark ages of chemical film, photographers used different lenses and filters to change colors, highlight some details over others and bring some subjects into sharp focus while blurring others. Pictures lie and tell the truth all at once.

Managers use mental lenses and filters for many of the same reasons. They look at the world through them to color facts, highlight some more than others and bring some subjects into sharp focus while blurring others. A manager's picture of reality lies and tells the truth all at once too.

In fact, most of us learn to use one filter quite well; we call it our point of view. Summer of Code

WHAT'S THE MATTER WITH KIDS TODAY? Lack of experience. At least that's what's wrong with fresh-out-of-school job applicants from the point of view of corporate IT. These kids may have perfectly respectable computer science educations.

But they've got no experience. Their IT knowledge is virtually all from theory, just about none from practice. The IT systems they've developed have typically been trivial, academic jobs. In the real world of corporate IT, they have a lot to learn.

So last week's announcement that Google is sponsoring a "Summer of Code" is great news for IT. Or terrible news. Or maybe both.

The idea is simple enough: A student age 18 or older can propose an open-source project at code.google.com/summerofcode.html. If the application is approved by an open-source sponsoring group, the student gets a \$500 stipend and mentoring. If the work is completed, the student can get an additional \$4,000 award and a T-shirt, and the open-source group gets \$500. Google's fronting the money for 200 applicants.

What does Google get for its million-dollar investment? A pile of goodwill with the open-source crowd, and probably an inside track for hiring any of those 200 winning applicants. If you think of it as a big internship program that pays each intern a meagly \$1,500 a month, you've got the right business model in mind.

Where it gets interesting is in what the students will have to do. They'll have to propose projects that have real, practical value to open-source groups such as The Perl Foundation, the Mono Project or Ubuntu Linux. They'll have to negotiate details and nail down plans.

Then they'll have to run the projects, which means making their code public on a site like SourceForge.net, dealing with all the input and complications of the open-source process and doing it all on the usual open-source budget: a threshold shoestring.

And if a program participant gives up and doesn't complete the project, no \$4,000 — and no T-shirt.

See the benefit? Nobody coming out of this "Summer of Code" deal will emerge believing an IT project is about algorithms, intelligence and elegance. Yeah, you need those things in real-world IT. But you also need business-value judgment, political savvy and skin thick enough

to handle code reviews by other programmers, not just professors and graduate assistants.

Those are qualities with real value to IT shops — qualities that come only from experience. Some programmers never gain those qualities. This summer, 200 student programmers almost certainly will.

Now, here's the downside: It's open-source. That means the experience will come in a tightly supervised environment. That's great for self-starters, but lousy as preparation for any IT department that practices micromanagement.

And it will come from squeezing out results on tight schedules with limited resources, not jockeying for more budget, more bodies and more time. In many IT shops, that lean-and-clean approach gets lots of lip service but it's actually a career-limiting strategy.

Most important, these students will come out believing they know how to do a successful real-world project. And they'll be right. But it won't necessarily be the way you'd want them to do a project.

That's the trade-off, for them and for us. They won't find themselves leaping off an ivory tower into a pit of real-world IT. They'll have practical experience. But they'll bring open-source notions that we may not be ready for.

And that's worth keeping in mind, whether you're lucky enough to snag a successful "Summer of Code" participant for a job interview or you're looking across your desk at any other job seekers whose résumés include work on open-source projects.

They'll have experience — but they'll still have a lot to learn.

Looks Like a Long, Hot Summer

User says that when he takes his laptop out of its case, it's very hot to the touch. The machine checks out OK, and support tech wonders aloud if maybe user just forgot to shut it down before packing it up. "I never shut down the laptop," user tells fish. "I just let it go into sleep mode, to save the time for bootup and shutdown." That's not wise, fish points out. "One of the techs in my department told me the same thing several times," user says. "But leaving it on never caused a problem before, so I just ignored the advice."

Widespread
Company Web site stops responding, and when fish fish plugs the servers, they don't respond either, so he heads for the server room. "It was 84 degrees inside," fish says.

"Servers were shutting down, humidity was through the roof, staff was shouting out — other chaps. Climate control had failed spectacularly, which puzzled us, as the system was supposed to phase an alert to the network admin if the temp got over 70 degrees." When fish heads down outdoors, he tells fish the alert system does work. "We have going off several times a night for months now, waking him up in the middle of the night," groans fish. "He yells the alarm, he shut off the alert system."

First Things First
Did you ever get a virus? User says he got a virus as he steps by user's desk. No, I just get to hate other people's bad news around, fish says. What's the problem? "The user then spent the next few minutes complaining that he had sent me an e-mail and I had not read it."

Another Bad Idea
PC gets bad, so support alert tech calls user for a few days in the middle of someone who's on vacation. Next morning, fish gets a frantic call: User says his mouse has exploded! "It hadn't even exploded as it had kind of melted," fish reports when he sees it. "I spent the night on the desk owner's USB-powered coffee-making hot plate — which the user had mistaken for a mouse pad."

SHARK TANK

not read it just," says fish. "He finally accepted the problem, and within a few minutes, I had taken care of the issue. When I returned in my room, I opened up my e-mail and found the message from the user. It read, in the entirety: 'Thanks son.'"

The Reason Why
Help desk pilot fish gets out from a user: "Over since I saw your face in the building, my printer has been eating money. Whenever the tech was working on your issue, I noticed something that in affecting my printer. Can someone come look at it?"

The blade made for Linux. The tools to make it better.

Put a world leader in blades and Linux to work for you. More and more businesses are finding that HP BladeSystem servers are the tool their data center needs. One reason is that HP's blades are optimized for Linux. Not only do they ship with powerful software tools, like HP Systems Insight Manager and ProLiant Essentials, they also run key Linux apps from software partners like PeopleSoft and Oracle. And with powerful AMD Opteron™ Processors, you get maximum performance now as well as the flexibility to transition to 64-bit computing now or in the future. In short, HP offers you the advantages of blades, Linux and legendary HP reliability all in one neat, affordable package. Get more support, technology and advice from HP. So you can build the IT you need.

HP ProLiant BL25p Blade Server

HP ProLiant BL35p Blade Server

THE SOLUTIONS

- R125p 2 AMD Opteron™ Processors Model 200 (up to 2.6GHz)
- R135p 2 AMD Opteron™ Processors Model 200 (2.4GHz)
- R125p Up to 48 servers per rack
- R135p Up to 96 servers per rack
- HP Systems Insight Manager™ for Web-based networked management through a single console
- Rapid Deployment Pack for ease of deployment or ongoing provisioning and re-provisioning in Linux-based OS environments (optional)

THE BENEFITS:

- Up to 23% savings on acquisition cost
- Up to 23% less power consumption
- Up to 92% fewer cables
- 43% less space needed for same number of processors
- Hot-swappable server design
- Single interface for local and remote management of servers, storage, software and networking

Enhance your system

HP STORAGEWORKS MSA1500CS

- Up to 24TB of capacity (96 250GB SATA drives) - Up to 16TB of capacity (300GB SCSI drives) - Ability to mix SCSI and Serial ATA enclosures for greater flexibility - 2GB/1GB Fibre connections to host flexibility

Save up to \$848 on the 4-hour response, 24-hour-a-day, 3-year warranty upgrade

Save \$1,744 when you purchase an HP BladeSystem enclosure and 8 BladeSystem Management Suite Licenses.¹
